Descriptors: *Biodegradation, *California, *Clean-up operations, *Decontamination, *Evaporation ponds, *Land disposal, *Pesticide residues, *Soil contamination, *Toxic wastes, *Waste disposal, Acids, Hydrogen ion concentration, Lime, Nutrients, Organic matter, Soil amendments, Soil properties, Soil types, Soil water.

The primary method for disposing of liquid pesticide wastes in California has been the dumping of the liquid materials into soil evaporation pits, ditches, and ponds, most of which are unlined and have been in use for many years. An investigation was undertaken to determine the optimum conditions for degrading high concentrations of pesticides in the soil. Soils at a northern California site were removed from the evaporation pit and placed in trays. Additional trays were prepared which contained similar soil fortified with six pesticides (atrazine, trifluralin, malathion, diazinon, chlorpyrifos, and parathion) and which were subjected to various soil amendments, including organic matter, lime, acids, and nutrients, under moist and flooded conditions. The effects of the soil amendments on the pesticide-fortified soils were generally pesticide dependent. The pH of the soils was a major factor in degradation and there was a pH difference between the anaerobic and aerobic soils. Under anaerobic conditions, half lives of most pesticides were shorter in the soils with highest pH, while the opposite was true under aerobic conditions. Treatment with manure, ammonium phosphate, and lime was very effective in reducing the half lives of pesticides in soils from the evaporation pit (under both aerobic and anaerobic conditions); treatment with cornmeal and ammonium phosphate was less effective. Under alternating moist and flooded soil conditions, a heavy lime treatment combined with a source of organic substances (such as manure) should provide an effective degradation of the pesticides in a contaminated toxic waste site. SHORT TERM RESPONSE TO EUTROPHICATION ABATEMENT.
Senter for Industriforskning, Oslo (Norway).
K. L. Seip, H. Sas, and S. Vermij.
Aquatic Sciences AQSCEA, Vol. 52, No. 3, p 199-220, 1990. 6 fig, 2 tab, 21 ref, append.

Descriptors: *Chlorophyll a, *Eutrophic lakes, *Lake restoration, *Limnology, *Model studies, *Phosphorus, Chlorophyll, Lakes, Mathematical studies, Regression analysis, Water chemistry.

Reduction of nutrient loadings to lakes is a common restoration measure for eutrophic lakes. On a chlorophyll-a/total phosphorus graph a positive response would be represented by a displacement towards the origin. The results of a new model for predicting the short term interannual changes in chlorophyll-a in lakes after reductions in total phosphorus were compared with predictions made by least squares regression models. In the new method, slopes of chlorophyll-a/total phosphorus graphs were depicted in frequency diagrams and used to extract information on the expected, short term chlorophyll-a/total phosphorus response. The short term response for nine shallow (< 10 m deep) and nutrient rich lakes to changes in total phosphorus was found to be: chlorophyll-a = 0.49(total phosphorus) + 17.3, and for nine deep, phosphorus-limited lakes: chlorophyll-a = 0.08(total phosphorus) + 3.5. If the total phosphorus-reduction was known to be greater than 10 mg/cu m, the expected slope increased to 0.58 for shallow lakes and to 0.26 for deep lakes. The slope, 0.58, was 8% lower than the slope for the long term response calculated by regression for the shal-

low lakes. For deep lakes the slope, 0.26, was 2 to 3 times higher than that calculated by regression, indicating that reductions in total phosphorus for deep lakes gave greater effects than least squares regression equations suggest. The reduction in total phosphorus gave about 80% probability that a reduction in chlorophyll-a would be observed next year. For shallow, phosphorus-limited lakes this reduction was about 30 mg/cu m (5% of average initial in-lake total phosphorus concentration), and for deep lakes about 14 mg/cu m (35% of average initial in-lake total concentration). REVISION OF THE SAPROBIC SYSTEM (EINE REVISION DES SAPROBIENSYSTEMS).
Landesamt fuer Wasser und Abfall Nordrhein-Westfalen, Duesseldorf (Germany, F.R.).
G. Friedrich.
Zeitschrift fuer Wasser - und Abwasser Forschung ZWABAQ, Vol. 23, No. 4, p 141-152, August 1990. 5 tab, 27 ref. English summary.

Descriptors: *Benthos, *Bioindicators, *Limnology, *Monitoring, *Pollution index, *Saprobic index, *Water quality, Germany, Heterotrophic bacteria, Running waters, Statistical analysis, Water chemistry.

The saprobic system, originally established in 1902, and revised later on, has been screened and revised within the standardization of the German methods for the examination of water, wastewater and sludge. A working group, consisting of experienced limnologists, made use of the results from long-term biological water quality studies in West Germany, which included statistical data management and data from chemical analysis of water. The revision of the list of indicators was based upon the following criteria: only benthic organisms are included, pertinent to the current investigation; organisms should be widespread over Central Europe; organisms should be identifiable with available keys; photoautotrophic species are excluded, according to the definition of saproby as the intensity of the heterotrophic activity, and in order to avoid overlapping with the indication of trophy; and benthic organisms included should have as narrow as possible a saprobic valance. A 20 point distribution is used to characterize the saprobic valency between oligosaprobic and polysaprobic. The indicator values (g) are graduated 1, 2, 4, 8, and 16 in order to discriminate between species with narrow saprobic valency and those with broader valency. The range of validity and use of the saprobic index are limited to permanent or temporary running waters. The difficulties arising in alpine or quasi standing waters are recognized as well. The revision of the saprobic index will be completed as DIN 38410 part 2. (Author's abstract)

TOXIC-SUBSTANCE CONTROL FOR THE OHIO RIVER.
Ohio River Valley Water Sanitation Commission, Cincinnati.
P. Tennant, A. Vicory, C. Norman, and P. McConocha.
Water Environment & Technology WAETEJ, Vol. 2, No. 10, p 59-63, October 1990. 5 fig.

Descriptors: *Environmental policy, *Interstate commissions, *Ohio River, *Toxic wastes, *Water pollution control, *Water quality control, Data collections, Interagency cooperation, Nonpoint pollution sources, Water analysis, Water pollution prevention, Water quality, Water treatment.

Before the widespread application of pollution abatement technology, the Ohio River and its tributaries suffered severe water quality degradation as a consequence of the basin's economic growth. In 1948, eight states signed a compact pledging cooperation to restore and maintain the quality of the valley's waters. The Ohio River Valley Water Sanitation Commission (ORSANCO) was created to oversee the compact's implementation and consists of three members from each state and three members representing the federal government. In the commission's early years, the major challenge was to provide some degree of treatment for the many waste discharges to the Ohio River and its tributaries. In the late 1970s, concerns over the presence of toxic substances in water caused the commission to appoint a task force to develop a toxics-control strategy. For the Ohio River as a whole, the most frequently detected toxic substances were zinc, copper, and chloroform, each of which was found in over 70% of the samples analyzed. It was decided to initiate investigations of each of the 10 segments used in the initial report completed in 1987. Investigations have been completed for the 117-mile segment from Wheeling to Parkersburg, WV, and the 87-mile segment from Pittsburgh, PA to Wheeling, WV. A third segment investigation, covering the 100 miles from Cincinnati to Louisville has been initiated. Results from the first two segment investigations indicate that nonpoint sources of toxics including runoff and groundwater contributions may be as significant as point-source discharges in determining levels of toxics in the Ohio river. Future field studies under the commission's toxic substances control program will make greater use of sediment sampling and will address smaller study areas in order to better use limited funds for laboratory analysis. ACCURATE METHOD FOR CALCULATION OF SATURATION DO.
Wuxi Pearl Lustre Pigment Factory (China).
H. Hua.
Journal of Environmental Engineering (ASCE) JOEEDU, Vol. 116, No. 5, p 988-990, 1990. 2 tab, 3 ref.

Descriptors: *Dissolved oxygen, *Mathematical analysis, *Mathematical equations, *Water quality, Monitoring, Oxygen, Precision, Water quality control.

Dissolved oxygen (DO) concentration is an important water quality index. In calculating the reaeration rate, an accurate saturated DO value is crucial. Engineers have been seeking a reliable method for the accurate calculation of the saturated DO concentration. Based on a careful study of the mechanism of gaseous solubility, a new formula for calculating the saturation DO is deduced. According to this study, it is assumed that two physical processes exist between the gaseous and the liquid phases: (1) the dissolution of gas, which depends on its diffusion rate; and (2) the vaporization of the gaseous component, which has already dissolved in the liquid phase. When the vaporization rate is equal to the diffusion rate, a dynamic equilibrium between the gaseous phase and liquid phase is established. Based on these assumptions, the gaseous solubility equation is created. Based on this equation, a new formula for calculating the saturation value of oxygen was obtained which is applicable to both seawater and fresh water from O C to 50 C. The new formula gives an accuracy higher than that obtained by previous equations. The average relative error is only 0.31%, and the average absolute error is 0.03 mg/L. (Lantz-PTT)

GUIDANCE DOCUMENT FOR PROVIDING ALTERNATIVE WATER SUPPLIES.
Environmental Protection Agency, Washington, DC. Office of Emergency and Remedial Response.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-167969. Price codes: A04 in paper copy, A01 in microfiche. Report No. EPA/540/G-87/006, February 1988. 3 fig, 3 tab, 19 ref, append.

Descriptors: *Decision making, *Water quality, *Water supply development, Drinking water, Potable water, Remedies, Superfund, Water quality control, Water supply.

EPA has developed guidelines for providing information, when it becomes necessary, to develop or obtain alternate water supplies where releases of hazardous substances or pollutants have resulted in the closing of drinking water wells, or has contaminated a principal drinking water supply. This information was prepared to assist Superfund contractors and on-scene Federal, State and local officials with the planning and implementation of alternate water supplies at uncontrolled hazardous waste sites. Guidance is specifically provided for those sites that do not require a time critical removal action, but do require provision of an alternate water supply as either a non-time-critical removal action of 6 months or more, or a remedial action before implementation of a final remedy can be achieved (actions performed at National Priority List sites where short-term threats to the human population exist). These remedial actions are used to provide faster responses than can be achieved

with normal remedial actions. The decision making process used in this document discusses the determination of water supply needs, screening and evaluating alternatives, and remedy implementation. (Author's abstract)

EVALUATION OF THE NUTTING LAKE DREDGING PROGRAM.
Baystate Environmental Consultants, Inc., East Longmeadow, MA.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-181895. Price codes: A10 in paper copy, A01 in microfiche. February, 1987. 117 p, 32 fig, 3 tab, 16 ref, 3 append.

Descriptors: *Dredging, *Lake restoration, *Nutting Lake, *Water quality, Dissolved oxygen, Domestic wastes, Lake sediments, Performance evaluation, Recreation, Sediment control, Wastewater disposal, Water quality control.

The Nutting Lake Program was conceived as a means to both develop and demonstrate an effective inland dredging method, and to restore recreational utility to a suburban lake. Between 1978 and 1986 an estimated total of 361,000 cubic yards (276,000 cu m) of soft sediment was removed from Nutting Lake by hydraulic dredging. Except for occasional sanitary sewer overflows and diminishing residual inputs from onsite wastewater disposal systems, the influence of domestic wastewater on Nutting Lake has been eliminated. However, the dredging operation was not as successful. Considerable quantities of soft sediment remain in the lake, and the actual volume of sediment removed by dredging may be as low as 224,000 cu yds. Stormwater inputs and dredging activities appear to have destabilized the system during the project; therefore, water quality is more variable and not appreciably better than before the program commenced. The only statistically significant change in water quality was an increase in the dissolved oxygen saturation level at the surface of the east basin and throughout the west basin of Nutting Lake. Future monitoring will be needed to evaluate long-term trends in water quality, but at this time the water quality benefits of the program appear negligible. However, reduction of macrophyte nuisances in selected areas has fostered increased use of Nutting Lake for swimming and boating. (Lantz-PTT)

ECONOMIC BENEFIT CONSIDERATIONS IN SELECTING WATER QUALITY PROJECTS. INSIGHTS FROM THE RURAL CLEAN WATER PROGRAM.
Economic Research Service, Washington, DC. Resources and Technology Div.
S. Piper, R. S. Magleby, and C. E. Young.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-194385. Price codes: A03 in paper copy, A01 in microfiche. May 1989. 28 p, 3 fig, 8 tab, 60 ref.

Descriptors: *Cost-benefit analysis, *Project planning, *Rural Clean Water Program, *Rural areas, *Water pollution prevention, *Water quality, Agricultural runoff, Agriculture, Bacteria, Land use, Nutrients, Sediments, Water quality control, Water use.

Runoff from agricultural land carries sediment, nutrients, bacteria, and pesticides into lakes, rivers, and streams. Elevated levels of these pollutants can harm recreation, water supplies, commercial fishing, and wildlife. The Rural Clean Water Program (RCWP) was initiated in 1980 by the US Department of Agriculture and the US EPA to demonstrate the effectiveness of agricultural best management practices (BMP's) in improving water quality and reducing the offsite effects of nonpoint source water pollution. The RCWP projects most likely to generate the highest offsite benefits are those aimed at preserving or improving water quality in a heavily used lake or estuary within or immediately adjacent to the project area. The extent of the benefits generated will depend on the level of the use impairment and the improvement in water quality. The RCWP projects with nutrient or bacteria problems frequently have a larger number of impaired water uses and potentially higher benefits than do projects with sediment problems. The cost of treating bacteria, nutrients, and sediment with structural practices such as animal waste storage systems and terraces is high compared with the cost of treating sediment and nutrient runoff through low-cost management practices such as conservation tillage. When benefits are potentially very high, more expensive structural practices and improvements appear justifiable, particularly if need to bring water quality to threshold levels where user benefits are generated. About a third of the RCWP projects have strong prospects for offsite economic benefits exceeding costs. Another third have the potential for positive net benefits if additional benefits can be generated by becoming part of larger regional programs that successfully sustain or expand uses of downstream major water resources. A few projects would have had better prospects for net benefits if costs had been reduced by greater reliance on management practices rather than structures such as terraces. (Lantz-PTT)

CONTAINMENT OF ORGANIC LEACHATES FROM LEAKING UNDERGROUND STORAGE TANKS USING TAILORED SOILS AS LINERS.
Argonne National Lab., IL. Energy and Environmental Systems Div.
R. W. Peters, F. Cadena, and M. W. Page.
Available from the National Technical Information Service, Springfield, VA 22161, as DE89-013180. Price codes: AO3 in paper copy, AO1 in microfiche. 35 p, 10 fig, 4 tab, 28 ref. DOE Contract W-31-109-Eng-38.

Descriptors: *Liners, *Soil liners, *Storage tanks, *Underground storage, *Water pollution control, *Water pollution prevention, Adsorption, Benzene, Clays, Model studies, Organic pollutants, Solute transport.

The technical feasibility of using tailored soils for containment of hazardous organic pollutants has been demonstrated. The adsorptive properties of soils for benzene are dramatically improved using organophilic coatings. Tailoring of the soils results in a highly selective adsorbent, which has a great capacity to remove benzene, toluene, and xylene (BTX) compounds. All four soils studied showed significant adsorptive capacity improvement after tailoring with tetramethylammonium ions (TMA+). The optimum TMA+;CEC (cation exchange capacity) ratio was between 0.6 and 1.5. Soils tailored at TMA+ doses as low as 50% of the CEC of the soil removed significant amounts of benzene from solution. pH plays a secondary role in the adsorption of benzene on the tailored soils. The capacities for benzene removal under dynamic column conditions were about 40-75% lower than those predicted from batch adsorption studies. The holdup of benzene increases with increasing clay content of the soils. The breakthrough curves for the pollutant movement through the soil columns can be predicted using conventional one-dimensional solute transport models. (Author's abstract)

SUPERFUND RECORD OF DECISION: TODTZ, LAWRENCE FARM, IA. FIRST REMEDIAL ACTION--FINAL.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-229553/AS. Price codes: AO4 in paper copy, AO1 in microfiche. Report No. EPA/ROD/R07-89/022. November 1988. 59p, 10 fig, 6 tab.

Descriptors: *Cleanup operations, *Groundwater pollution, *Iowa, *Landfills, *Site remediation, *Superfund, Arsenic, Benzene, Chromium, Costs, Heavy metals, Lead, Toluene, Volatile organic compounds.

The 2.7-acre Dupont Impoundment of the Todtz Farm site is part of the 12-acre parcel of land known as the Todtz Farm Landfill, which is located on a 120-acre farm 1.25 miles west of Camanche, Iowa. Originally a sand and gravel mine, the landfill received municipal waste from 1969 to 1975. In 1971, Dupont constructed the impoundment in the northwest corner of the landfill and disposed of an estimated 4,300 tons of wet end cellophane process wastes from 1971 until its closure in 1975. Impoundment wastes are periodically in direct contact with the groundwater beneath the site, which flows southeasterly toward the Mississippi River. Domestic wells and the municipal water supply wells for Camanche located downgradient of the site may be affected by contamination from the site. In addition, several ponds and lakes in the vicinity are potential receptors for contaminated runoff and recharge. The primary contaminants of concern affecting the groundwater

are volatile organic carbons (VOCs) including toluene and benzene, and metals including arsenic, lead, and chromium. The selected remedial action for this site includes installation of a soil cover over the Dupont Impoundment; implementation of institutional controls including deed and land use restrictions; provision of an alternate water supply for an affected residence by relocating an existing well; and groundwater monitoring. EPA has determined that further remedial actions will be immediately implemented if groundwater trigger levels provided in the Record of Decision (ROD) are met or exceeded. If groundwater monitoring indicates that contaminant levels exceed the less stringent chemical-specific action levels provided in the ROD, groundwater pumping and treatment will be implemented; if the more stringent action levels are exceeded, a treatability study of the impoundment waste will be conducted and either a permanent treatment remedy of the impoundment material or a cap and slurry wall containment system will be implemented. The estimated present worth cost for this remedial action is $1,030,000. (Author's abstract)
W91-02649

IN-SITU AQUIFER RESTORATION OF CHLORINATED ALIPHATICS BY METHANOTROPHIC BACTERIA.
Stanford Univ., CA. Dept. of Civil Engineering.
P. V. Roberts, L. Semprini, G. D. Hopkins, D. Grbic-Galic, and P. L. McCarty.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-219992/AS. Price codes: A11 in paper copy, AO1 in microfiche. Report No. EPA/600/2-89/033. July 1989. 232p, 123 fig, 43 tab, 166 ref.

Descriptors: *Aliphatic hydrocarbons, *Biodegradation, *Biological treatment, *Cleanup operations, *Groundwater pollution, *In situ treatment, *Methane, *Methane bacteria, *Water pollution treatment, Aerobic conditions, Biotransformation.

The potential of enhanced in-situ biotransformation of chlorinated aliphatic solvents by a bacterial community grown on methane under aerobic conditions was examined. The target chlorinated compounds were trichloroethene (TCE), cis-, and trans -1,2-dichloroethene (DCE), and vinyl chloride (VC). Laboratory studies were conducted to improve understanding of the microbial growth and transformation rates and to characterize important transport properties. In field experiments, biostimulation was accomplished by introducing methane and oxygen into a shallow, confined, sand and gravel aquifer to encourage the growth of a native bacterial community. Methane utilization commenced within ten days in the first biostimulation attempt, and within one day in subsequent biostimulation episodes. Biotransformation of the target organic compounds ensued immediately after commencement of methane utilization, and reached steady-state values within three weeks. The approximate extents of transformation were as follows: VC, 95%; trans-DCE, 85%; cis-DCE, 40%; and TCE, 20%. Mathematical modeling of the transport and transformation process confirmed that the behavior observed in the field demonstration was consistent with the results of the laboratory research and theoretical expectations. This technology has been demonstrated to be effective in continuous operation under carefully controlled conditions in a real subsurface environment at small scale. (Author's abstract)
W91-02650

SUPERFUND RECORD OF DECISION: BERKS SAND PIT, PA. FIRST REMEDIAL ACTION-FINAL.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-206361/AS. Price codes: AO3 in paper copy, AO1 in microfiche. Report No. EPA/ROD/R03-88/060. September 1988. 38p, 7 fig, 8 tab.

Descriptors: *Cleanup operations, *Groundwater pollution, *Site remediation, *Superfund, *Water pollution treatment, Costs, Pennsylvania, Volatile organic compounds, Water supply.

The three to four-acre Berks Sand Pit site is located in Longswamp Township, Berks County, Pennsylvania. There are at least 20 single family homes within the investigation area, including one on top of the actual sand pit. The immediate vicinity of the site is zoned for low density residential use. The Berks Sand Pit was created by the removal of sand and gravel, but reportedly was used by area residents for refuse disposal. Industrial waste also was alleged to have been disposed of in the area around the pit. Houses were constructed and private wells installed at the location beginning in 1978, after the pit was backfilled. The site first came to the attention of EPA in January 1982 when area residents detected groundwater contamination. Emergency actions were undertaken by EPA in the summer of 1983. The pit was partially excavated and backfilled with clean fill, but no pocket of contamination was discovered. The primary contaminants of concern affecting the groundwater, surface water, and sediments are volatile organic carbons (VOCs) including 1,1,1-TCA, 1,1,-DCA, PCE, and 1,1-DCE. The selected remedial action for this site included: excavation of contaminated sediments with offsite treatment by incineration; groundwater pump and treatment using air stripping and vapor phase carbon absorption with reinjection of treated water back into the aquifer; provision of an alternate water supply system, surface and groundwater monitoring; and restrictions to prevent installation of drinking water wells in the contaminated aquifer. The estimated present worth cost for this remedy is $10,773,100, with annual operating and maintenance costs of $459,200. (Author's abstract)
W91-02651

SUPERFUND RECORD OF DECISION: MOTOROLA (52ND STREET PLANT), AZ. FIRST REMEDIAL ACTION.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-204861. Price codes: AO3 in paper copy, AO1 in microfiche. Report No. EPA/ROD/R09-88/024. September 1988. 48p, 2 fig.

Descriptors: *Arizona, *Cleanup operations, *Groundwater pollution, *Organic solvents, *Site remediation, *Soil contamination, *Superfund, *Water pollution treatment, Costs, Phoenix, Scrubbers, Storage tanks, Trichloroethane, Underground storage.

The Motorola 52nd Street site is located in the eastern part of the City of Phoenix, Maricopa County, Arizona. The site is bounded by the Phoenix Military Reservation and mixed residential and commercial neighborhoods. The site is currently owned by Motorola, Ind., which operates a manufacturing facility at the site using solvents for various manufacturing processes. In January 1983, Motorola tested some underground storage tanks used to store virgin solvents for leaks and determined that a 5,000-gallon tank containing 1,1,1-trichloroethane (TCA) was leaking. Subsequently, Motorola conducted a preliminary investigation, which indicated soil and groundwater contamination on the plant site and groundwater contamination offsite to the west. Motorola initiated an onsite groundwater treatment program in 1986, which included treatability testing, design and installation of a Pilot Treatment Plant (PTP), treatment of groundwater, and beneficial use of the effluent in the plant's air fume scrubbers. The PTP is still in operation. The selected remedy for this Record of Decision (ROD) requires partial cleanup of onsite and offsite organic solvents contamination in the soil and alluvium groundwater. A subsequent remedial action will address cleanup of all onsite and offsite contamination in the soil, alluvium groundwater, and the bedrock underlying the alluvium. The primary contaminant of concern affecting the soil and groundwater is TCA. The selected remedial action for this site includes: onsite soil-gas extraction and treatment using granular activated carbon systems; pump and treatment of on-site and off-site groundwater with treatment onsite and use of the treated groundwater in site manufacturing processes; and groundwater monitoring. The estimated present worth cost for this remedial action is $7,600,000 with annual O&M costs of $700,000. (Author's abstract)
W91-02652

SUPERFUND RECORD OF DECISION: SELMA PRESSURE TREATING COMPANY, CA. FIRST REMEDIAL ACTION--FINAL.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-204853/AS. Price codes: AO6 in paper copy, AO1 in microfiche. Report No. EPA/ROD/R09-88/025. September 1988. 123p, 5 fig, 2 tab.

Descriptors: *California, *Chemical wastes, *Cleanup operations, *Groundwater pollution, *Site remediation, *Soil contamination, *Superfund, *Water pollution treatment, Arsenic, Chromium, Costs, Dioxins, Heavy metals, Pentachlorophenol, Remediation measures.

The Selma Pressure Treating Company is located in Selma, California, 15 miles south of the city of Fresno. The site encompasses approximately 18 acres, including a 3 to 4-acre wood treatment facility and 14 acres of adjacent vineyards that were used for site drainage. Land use in the vicinity of the site includes agricultural, residential and industrial areas, with 12 residences and businesses located within 0.25 mile. The groundwater resources in the area have been classified as a Sole-Source Aquifer and a current drinking water source with other beneficial uses. Wood preserving activities using pentachlorophenol (PCP) were conducted at the site from 1942 until 1965 under a series of owners. In 1965, a new facility was constructed converting operations to a pressure treating process using chemical preservatives. Prior to 1982, wastes generated from spent retort fluids and sludges were discharged to drainage and percolation ditches, dry wells, and an unlined pond and sludge pit, as well as onto open ground and the adjacent vineyards. An inspection conducted by EPA in 1981 raised concerns about the potential for groundwater contamination, and as a result the company was required to modify its operations to minimize the potential for contamination. The total volume of soil requiring remediation is approximately 16,000 cu yds. The primary contaminants of concern affecting the groundwater and soil are organics including dioxin and phenols, and metals including arsenic and chromium. The selected remedial action for this site includes: groundwater pump and treatment using precipitation, coagulation, and flocculation with reinjection into the aquifer or offsite discharge; soil excavation and solidification/stabilization with replacement in excavated areas and capping fixed soil with RCRA cap; groundwater and soil monitoring for approximately 30 years; and long-term access and land use restrictions for fixed areas and short-term institutional controls for groundwater use. The estimated present worth cost for this remedial action is $11,280,000 with an annual operation and maintenance of $1,300,000. (Author's abstract)

SUPERFUND RECORD OF DECISION CANNON ENGINEERING, MA. FIRST REMEDIAL ACTION--FINAL.
Environmental Protection Agency, Washington DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-225577/AS. Price codes: A11 in paper copy, AO1 in microfiche. Report No. EPA/ROD/R01-88/031 March 1988. 228p, 3 fig, 9 tab, 3 append.

Descriptors: *Cleanup operations, *Industrial wastes, *Massachusetts, *Site remediation, *Soil contamination, *Superfund, Benzene, Costs, Monitoring, Polychlorinated biphenyls, Polycyclic aromatic hydrocarbons, Remediation measures, Storage tanks, Vinyl chloride, Volatile organic compounds.

The Cannon Engineering Corporation (CEC) facility is located in a small industrial park in the western part of the Town of Bridgewater, Plym

uth County, Massachusetts. The four-acre site is ordered by industrial developments to the north nd east and a wooded lowland to the south and vest. A wetland area lies south and west of the te. CEC, which has owned the property since 974, handled, stored, and incinerated chemical vaste onsite from 1974 to 1980. EPA conducted te investigations between 1980 and 1982, and in October 1982, Massachusetts contracted for the emoval of sludge and liquid waste from onsite nks and drums. In January 1988, EPA provided or the removal and disposal of numerous hazard- us materials abandoned at the site. This remedial ction addresses three discrete areas of soil and ediment contamination located in the northwest- rn and southern portions of the site, and the uildings, tanks, and other contaminated structures nsite. The volume of contaminated soil is estimat- d to be 325 cu yds. The primary contaminants of oncern affecting the groundwater, soil, and debris e VOCs including benzene, TCE, and vinyl chlo- de, and other organics including PCBs and AHs. The selected remedial action for this site cludes: access restrictions; excavation and onsite eatment of VOC-contaminated soil by thermal ration, and excavation and offsite treatment of CB-contaminated soil by incineration; decontami- ation, removal, and disposal of contaminated uildings, tanks, and structures; additional soil sam- ing to assess effectiveness; groundwater monitor- g and implementation of a water quality monitor- g program to assess natural attenuation of con- minants; and institutional controls to restrict nsite groundwater use. The estimated present orth cost for this remedial action is between ,400,000, and $4,505,000 with present worth op- ation and maintenance of $700,000. (Author's stract)

UPERFUND RECORD OF DECISION: AVTEX BERS, VA. FIRST REMEDIAL ACTION.
nvironmental Protection Agency, Washington, C.
vailable from the National Technical Information rvice, Springfield, VA 22161, as PB89-206197/ S. Price codes: AO5 in paper copy, AO1 in crofiche. Report No. EPA/ROD/R03-88/055. ptember 1988. 80p, 5 fig, 10 tab.

escriptors: *Cleanup operations, *Groundwater llution, *Industrial wastes, *Site remediation, uperfund, *Virginia, *Water pollution treatment, senic, Costs, Fly ash, Heavy metals, Lead, enols, Polyester, Polypropylene, Rayon, Reme- ation measures.

e 440-acre Avtex Fibers site is located in arren County, Front Royal, Virginia. The facili- is bounded to the west and northwest by the enandoah River and to the south, northwest, d east by residential areas. Approximately i,300 ople live within one mile of the site. The western rt of the site lies within the limits of the Shenan- ah River's 100-year floodplain. The Avtex ers site has produced rayon fibers since 1940, lyester between 1970 and 1977, and polypropyl- since 1985. During this 48-year period, byprod- s from the rayon manufacturing process were posed of in onsite surface impoundments. These roducts included sodium cellulose xanthate- ed viscose and zinc-hydroxide sludge. Fly ash om incinerator exhaust air pollution control de- es) and boiler house solids were disposed of in e other surface impoundments. Land disposal of cose waste ceased in 1983; since that time, the ste has been routed directly to an onsite stewater treatment plant. In 1982, carbon disul- , a constituent of viscose waste, was identified groundwater samples from residential wells lo- ed across the Shenandoah River from the site. response to the results of a groundwater investi- ion Avtex implemented interim measures, ich included purchasing 23 subdivision proper- on the west side of the river that had contami- ed domestic wells, and initiating a groundwater np and treatment program. This Record of De- on (ROD) is the first of two operable units and resses groundwater remediation and interim re- dial measures for the viscose basins responsible groundwater contamination. A subsequent re- dial action will address source control and vis- cose basin remediation. The primary contaminants of concern affecting the groundwater are phenols, and metals including arsenic and lead. The selected remedial action for this site includes: groundwater and basin liquid pump and treatment in the existing onsite activated sludge wastewater treatment plant, following completion of necessary upgrades, modifications, and construction of pretreatment units, with offsite discharge of treated water to the Shenandoah River; monitoring on-site and off-site groundwater, surface water, and basin fluids; and placing deed restrictions prohibiting the use of groundwater on the affected properties. The estimated present worth cost for this remedial action is $9,122,000. (Author's abstract)
W91-02656

SUPERFUND RECORD OF DECISION: FINDETT, MO. FIRST REMEDIAL ACTION.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-229538/ AS. Price codes: AO3 in paper copy, AO1 in microfiche. Report No. EPA/ROD/R07-89/023. December 1988. 43p, 8 fig, 3 tab.

Descriptors: *Cleanup operations, *Groundwater pollution, *Industrial wastes, *Missouri, *Site remediation, *Soil contamination, *Superfund, *Water pollution treatment, Air stripping, Costs, Groundwater pumping, Polychlorinated biphenyls, Remediation measures, Volatile organic compounds.

The Findett/Hayford Bridge Road Groundwater site is located just north of the City of St. Charles, in St. Charles County, east-central Missouri. The site lies 3.2 miles south of the Mississippi River and is within the floodplain. Land use in the site vicinity is primarily agriculture, but also includes a small industrial park containing Findett Corporation, Cadmus Corporation, and several other commercial and light industrial establishments. In addition, there are several residences within approximately 1,000 feet northeast and 1,500 feet south of the site. The Elm Point Wellfield, the primary drinking water supply for St. Charles, is located 1,800 feet northeast of the site. Until 1980, Findett Corporation reclaimed heat transfer fluids or oils, some of which contained PCBs, and received waste solvents for reclamation or recycling. Subsequently, Findett has custom blended or manufactured organic chemicals for other companies. The Findett site originally came to EPA's attention when Findett Corporation reported handling PCBs at the site. There is PCB-contaminated soil at the Findett facility as well as the adjacent Cadmus Corporation Facility. The Elm Point Well Field is also at risk of contamination by releases from the site. Findett conducted several voluntary PCB soil cleanups pursuant to EPA Administrative Orders in 1981 and 1982; however, PCBs as well as VOCs remain in the soil in concentrations above recommended levels. In addition, groundwater investigations revealed substantial VOC contamination in the shallow aquifer near the contaminant sources and in the deep aquifer tapped by the nearby well field as a drinking water source. The primary contaminants of concern affecting the soil and groundwater are VOCs, and other organics including PCBs. The selected remedial action for this site includes onsite groundwater pumping and treatment using air stripping with discharge to the publicly owned treatment works (POTW); and excavation of contaminated soil with either offsite disposal or treatment. The estimated present worth cost for this remedial action is $8,306,000 with an annual operation and maintenance cost of $398,000. (Author's abstract)
W91-02657

SUPERFUND RECORD OF DECISION: SOUTH VALLEY/EDMUNDS STREET, NM. SECOND REMEDIAL ACTION.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-225528/ AS. Price codes: AO3 in paper copy, AO1 in microfiche. Report No. EPA/ROD/R06-88/037. June 1988. 47p, 3 fig, 2 tab.

Descriptors: *Cleanup operations, *Groundwater pollution, *Industrial wastes, *New Mexico, *Site remediation, *Superfund, *Water pollution treatment, Air stripping, Albuquerque, Costs, Groundwater pumping, Remediation measures, Volatile organic compounds.

The South Valley/Edmunds Street site is a large area in the southern part of the City of Albuquerque, New Mexico, surrounding the municipal water well known as San Jose 6. Within this large area are a number of industrial properties owned and operated by different groups and individuals. This remedial action addresses the Edmunds Street Ground Water operable unit of the South Valley site; the Edmunds Street property is located in the southeastern corner of the site. The focus of this operable unit is the area around the monitoring well SV-10, referred to as the drainage pit area, on the Edmunds Street property. This area is the low spot of the property and receives much of the property drainage. Analyses of this area have shown significant levels of industrial solvents in the soil, and a plume of contaminated groundwater starting at the drainage pit area and extending to the east. The groundwater source will be treated as a sole-source aquifer because there are no alternate sources available to the City of Albuquerque. The contaminated groundwater currently poses a direct threat to Albuquerque's water supply by moving toward the city's well fields. The primary contaminants of concern affecting the groundwater include VOCs such as PCE and TCE. The selected remedial action for this site includes ground water pumping and treatment using air stripping (packed tower aeration) with reinjection of the treated water into the aquifer through infiltration galleries; and groundwater and air monitoring. The present worth cost for this remedial action is $874,000, with present worth operation and maintenance costs estimated at $280,000. (Author's abstract)
W91-02658

SUPERFUND RECORD OF DECISION: COMMENCEMENT BAY/NEAR SHORE, WA. FIRST REMEDIAL ACTION.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-225544/ AS. Price codes: AO6 in paper copy, AO1 in microfiche. Report No. EPA/ROD/R10-88/011. December 1987. 109p, 8 fig, 5 tab, 3 append.

Descriptors: *Cleanup operations, *Coal gasification, *Groundwater pollution, *Industrial wastes, *Site remediation, *Soil contamination, *Superfund, *Washington, Benzene, Costs, Lead, Monitoring, Polychlorinated biphenyls, Polycyclic aromatic hydrocarbons, Remedial measures.

The Tacoma Tar Pits site covers approximately 30 acres within the Commencement Bay-Nearshore/ Tideflats site in Tacoma, Pierce County, Washington. The tar pits lie between the Puyallup River, the city, and Wheeler-Osgood Waterways. These bodies of water are not used as a water supply, but support extensive fish and shellfish populations. Currently there is concern for the site's impact on surface water quality and many local industries that use groundwater from onsite wells. In 1924, a coal gasification plant began operations, and continued until 1956, at which time they were terminated due to the availability of natural gas. During these years, waste materials from the coal gasification process were disposed of onsite. Contained in the waste materials, were a wide variety of organic compounds and heavy metals. From 1965 to 1966, the plant was dismantled and demolished. Most of the metal structures were removed from the site; however, all demolition debris and below grade structures were left in place, including tanks and pipelines containing tars. In 1967, a metal recycling company began operating at the site. Recycling of automobile batteries introduced acid, heavy metals, lead, and PCBs to the soil. Several studies conducted by EPA and the Washington State Department of Ecology between 1981 and 1988 found contaminants derived from the coal gasification

process. The primary contaminants of concern affecting surface water and soil included: benzene, polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls, and lead. The selected remedial action for this site includes: excavation of all contaminated soils exceeding 1% total PAHs and all surface soils exceeding a 0.000001 lifetime cancer risk level with stabilization of all excavated soils in a polymer/cement mixture; capping of the stabilized matrix with asphalt; channeling and managing of surface waters; groundwater monitoring; and removal and treatment of ponded water. The estimated present worth cost for this remedial action is $3,400,000. (Author's abstract)
W91-02659

SUPERFUND RECORD OF DECISION: MASON COUNTY LANDFILL, MI. FIRST REMEDIAL ACTION.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-206213/AS. Price codes: AO6 in paper copy, AO1 in microfiche. Report No. EPA/ROD/R05-88/080. September 1988. 115p, 18 fig, 8 tab.

Descriptors: *Cleanup operations, *Groundwater pollution, *Industrial wastes, *Michigan, *Site remediation, *Superfund, Aerators, Aquifers, Benzene, Costs, Gas vents, Landfills, Monitoring, Remediation measures, Volatile organic compounds, Xylenes.

The Mason County Landfill site is located three miles south of the City of Ludington, Mason County, Michigan. The site occupies approximately 18 acres of a predominantly rural area in Pere Marquette Township. Approximately 10 acres of the site were used as a landfill. Less than 500 feet from the landfill there is a wetland area which drains into Babbin Pond, the headwaters of Iris Creek. There are 14 residential wells within a 0.5 mile radius of the landfill. The population within a 3-mile radius of the site is estimated to be 1,112. The Mason County Department of Public Works (DPW) leased the property in 1971 and entered into an agreement with Acme Disposal, Inc. to operate the site as a sanitary landfill. Although the Michigan Department of Natural Resources (MDNR) documented that slurry and sludge wastes from local industries were being dumped at the landfill, the site's license was renewed annually until it was closed in August 1978 after reaching capacity. Public concerns over the water quality in Iris Creek prompted the DPW and MDNR to review closure activities. In 1983, a clay cap was installed over the landfill and berms and storm drains were constructed to improve site drainage. Two surface aerators were installed in Babbin Pond to facilitate biodegradation of organic matter and 15 gas vents were placed in the top of the landfill. The site has been separated into two operable units; one for the landfill contents and one for the groundwater. This source control remedial action addresses the landfill contents. Contamination of the shallow and deep aquifer will be addressed in a subsequent remedial action. Site investigations indicate that contamination of surface water, surface sediment, soil, and offsite air quality are not sufficient to warrant remedial action. The primary contaminants of concern affecting the groundwater are VOCs including benzene, PCE, TCE, and xylene. The selected remedial action for this site includes: construction of a RCRA cap over the landfill; access restrictions; deed restrictions on and near the site to prohibit use of the shallow aquifer; and groundwater monitoring. The estimated present worth cost for this remedial action if $2,800,000, with present worth operating and management costs of $1,000,000 over 30 years. (Author's abstract)
W91-02660

SUPERFUND RECORD OF DECISION: UNITED NUCLEAR CORPORATION, NM. FIRST REMEDIAL ACTION.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-206171/AS. Price codes: AO7 in paper copy, AO1 in microfiche. Report No. EPA/ROD/R06-88/044. September 1988. 130p, 11 fig, 10 tab, 18 ref.

Descriptors: *Cleanup operations, *Groundwater pollution, *Mine wastes, *New Mexico, *Nuclear wastes, *Site remediation, *Superfund, *Uranium, *Water pollution treatment, Arsenic, Costs, Evaporation, Groundwater pumping, Metals, Monitoring, Radionuclides, Radium, Remediation measures.

The United Nuclear Corporation (UNC) site is located approximately 17 miles northeast of Gallup, New Mexico, in McKinley County. The site operated as a State-licensed uranium mill facility from June 1977 to May 1982. It includes an ore processing mill (about 25 acres) and an unlined tailings pond area (about 100 acres). The surrounding area is sparsely populated, with the nearest residence located 1.5 miles from the site. In July 1979, approximately 23 million gallons of tailings and pond water were released to a nearby river as a result of a dam breach in the tailings pond area. The site damage was repaired; however, attention was focused on groundwater contamination resulting from tailings seepage. Consequently, UNC implemented a groundwater pumping system that withdrew groundwater from the aquifers underlying the site and sent it to an onsite borrow pit for evaporation. UNC also conducted tailings neutralization from late 1979 to early 1982. Nevertheless, the offsite migration of radionuclides and chemical constituents from uranium milling byproduct materials into the groundwater, as well as to surface water and air, are still principal threats at the site. This remedial action will address onsite groundwater contamination. Source control and onsite surface reclamation will be implemented under the direction of the Nuclear Regulatory Commission and integrated with this groundwater operable unit. The primary contaminants of concern affecting the groundwater are metals including arsenic and radioactive substances including radium-226/228 and gross alpha. The selected remedial action for this site includes: implementation of a groundwater monitoring program to detect any increases in the areal extent or concentration of groundwater contamination outside the tailings disposal area; groundwater pump and treatment using existing and/or new extraction wells to control and remove tailings seepage and remediate contaminated groundwater, with discharge to an enhanced mister/pond evaporation system; and implementation of a performance monitoring and evaluation program. The estimated present worth cost for this remedial action is $17,000,000 over a 10-year period, with estimated annual operation and management of $1,000,000. (Author's abstract)
W91-02661

SUPERFUND RECORD OF DECISION: SOUTHERN MARYLAND WOOD, MD. FIRST REMEDIAL ACTION--FINAL.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-206387/AS. Price codes: AO5 in paper copy, AO1 in microfiche. Report No. EPA/ROD/RO3-88/051. June 1988. 85p, 5 fig, 15 tab.

Descriptors: *Cleanup operations, *Industrial wastes, *Maryland, *Site remediation, *Superfund, *Water pollution sources, *Water pollution treatment, Activated carbon, Cylinder sludges, Groundwater pumping, Monitoring, Remediation measures, Retort sludges, Sedimentation, Surface water pumping, Volatile organic compounds.

The Southern Maryland Wood Treating (SMWT) site is located in Hollywood, St. Mary's County, Maryland. The site is situated within a wetland area in a drainage divide such that runoff from the site discharges into Brooks Run and McIntosh Run tributaries, which flow into the Potomac River. The area surrounding the site is predominantly used for agricultural and residential purposes. From 1965 to 1975, SMWT operated as a pressure treatment facility for wood preservation. Currently, part of the site is being used as a retail outlet for pretreated lumber and crab traps. The waste generated a the site included retort and cylinder sludges, process wastes, and material spillage. These wastes were in six onsite unlined lagoons. An onsite freshwater pond became contaminated during the facility's active and inactive periods with VOCs, polynuclear aromatics (PNAs), and base/neutral extractables due to contaminated groundwater and surface runoff. Cleanup actions were initiated in 1982 following legal actions by the Maryland Department of Health and Mental Hygiene. Liquids removed from the six lagoons were spray irrigated onto the nearby woods. The six lagoons were excavated, backfilled, and graded, and the freshwater pond was partially excavated. The excavated sludges were mixed with composited sludge and topsoil, and spread in a level treatment area located on the property. The primary contaminants of concern affecting the onsite groundwater soil, surface water, sediments, and debris include: VOCs, PNA, and base/neutral acid extractables. The selected remedial action for this site includes: excavation/dredging of soils, sediments, tank liquids, and cement, and treatment using onsite incineration with onsite disposal of non-hazardous residual ash, backfilling, regrading, and revegetating, where necessary; installation of a slurry wall; dewatering of the slurry wall area by a groundwater and surface water pumping system, and treatment using activated carbon adsorption or hydrogen peroxide and irradiation with discharge to the onsite pond; installation of a geotextile silt fence, sedimentation basins, and/or diversion; and groundwater, surface water, environmental, organic vapor, and dust monitoring. (Author's abstract)
W91-02662

SUPERFUND RECORD OF DECISION: M.W. MANUFACTURING, PA. FIRST REMEDIAL ACTION.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-229587/AS. Price codes: AO4 in paper copy, AO1 in microfiche. Report No. EPA/ROD/R03-89/067. March 1989. 51p, 2 fig, 7 tab.

Descriptors: *Cleanup operations, *Copper, *Groundwater pollution, *Industrial wastes, *Pennsylvania, *Site remediation, *Soil contamination, *Superfund, Costs, Incineration, Lead, Remedial measures, Solvents, Volatile organic compounds.

The M.W. Manufacturing site is a former copper recovery facility located in Montour County, Pennsylvania, two miles north of Danville. The Pennsylvania Department of Transportation (PennDOT) maintains a storage area immediately north of the site, and farmlands and wooded lots are adjacent to the site on the west and south. Mauses Creek flows in a southerly direction past the site. Several private residences, motels, gas stations, restaurants, and a Head Start School are located just north of the PennDOT storage area and rely on private groundwater wells for drinking water. M.W. Manufacturing was engaged in secondary copper recovery from scrap wire, using both mechanical and chemical processes. Granular carbon wastes generated by the chemical process were dumped onsite, and spent solvents and acids were allegedly disposed of onsite. In 1972, M.W. Manufacturing filed for bankruptcy and the Philadelphia National Bank acquired the property. Warehouse 81 Inc. acquired the site in 1976. and subsequently formed a limited partnership with Domino Salvage, Inc. to recover wire at the site using mechanical recovery only. The initial remedial investigation revealed several areas posing potential threats to public health: the carbon waste pile, four wire-fluff waste piles, a surface impoundment, buried lagoon and contaminated soils, drums and storage tanks. This remedial action addresses the concerns for direct contact with and migration to groundwater of contaminants from the carbon waste pile. The remaining areas are the subject of a long-term remedial investigation and feasibility study. The primary contaminants of concern affecting the soil are VOCs including PCE and TCE; organics including PCBs; and metals including lead. The selected remedial action for this site

includes excavating the carbon waste pile (approximately 875 cu yds of contaminated waste and contaminated underlying soils) and transporting the waste offsite to an incinerator facility and disposing of the ash in an offsite RCRA hazardous waste landfill. The estimated capital cost for this remedial action is $2,061,000. Since onsite remediation activities are anticipated to require less than one year, there are no operation and maintenance costs. (Author's abstract)
W91-02663

SUPERFUND RECORD OF DECISION: SOUTH VALLEY/SJ-6, NM. THIRD REMEDIAL ACTION.
Environmental Protection Agency, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-204804/AS. Price codes: AO4 in paper copy, AO1 in microfiche. Report No. EPA/ROD/R06-88/041. September 1988. 62p, 3 fig, 1 tab, 3 append.

Descriptors: *Cleanup operations, *Groundwater pollution, *Industrial wastes, *New Mexico, *Site remediation, *Soil contamination, *Superfund, Costs, Monitoring, Remediation measures, Solvents, Volatile organic compounds.

The South Valley/SJ-6 site is located on the southern margin of Albuquerque, New Mexico, just north of South Valley. The total site encompasses the SJ-6 municipal well, and six industrial facilities and their surrounding properties within an approximately one square mile radius. Land use is primarily industrial and agricultural with residential areas located immediately north of the site. Industrial development began in the South Valley area just prior to the 1940s. Metal parts were manufactured in the area starting around 1948. By the 1960s, organic chemicals were being handled and packaged on the site. Currently, petroleum fuels and various chlorinated organics are stored, handled and used within the South Valley areas. Groundwater contamination was first suspected in 1973 when foul tastes and odors were noted in groundwater from a private well on the Edmunds property in South Valley. Subsequent sampling revealed the presence of several VOCs in three municipal wells including SJ-6. One of the wells was resampled in 1988 and found to be free of contaminants, another well was taken out of service because of mechanical problems, and SJ-6 was shut down in 1980 due to the continual detection of low levels of solvents. This Record of Decision (ROD) addresses only the source and extent of groundwater contamination in the vicinity of JS-6. Principle threats at the site (i.e., the source and remanating plumes of contamination from surrounding areas) are being addressed through remedial actions initiated by EPA in separate RODs. The primary contaminants of concern affecting the groundwater are VOCs including 1,1-DCE, PCE and TCE. The selected remedial action for this site includes: removal and disposal of 100 cu yds of contaminated sediments at the base of the SJ-6 borehole; sealing abandoned wells; groundwater monitoring; and access restrictions. The estimated present worth cost for this remedial action is $4,000,000 with estimated an annual operation and maintenance of $300,000. (Author's abstract)

SUPERFUND RECORD OF DECISION: MIDDLETOWN AIR FIELD, PA.
Environmental Protection Agency, Washington, DC. Office of Emergency and Remedial Response.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-211684/AS. Price codes: A03 in paper copy, A01 in microfiche. Report No. EPA/ROD/R03-88/039, December 1987. 47p, 3 fig, 9 tab.

Descriptors: *Cleanup operations, *Groundwater pollution, *Pennsylvania, *Site remediation, *Superfund, *Volatile organic compounds, Air stripping, Costs, Drinking water, Groundwater pumping, Monitoring, Potable water, Remediation measures, Trichloroethene, Water pollution treatment.

The Middletown Air Field site covers what is now the Harrisburg International Airport (HIA), located between the town of Middletown and Highspire, Dauphin County, Pennsylvania. The airport is owned and operated by the Commonwealth of Pennsylvania Department of Transportation. Thearea surrounding the base is characterized as mixed residential/industrial. Between 1898 and 1962, the property was owned by the U.S. Government and used by the military. HIA and several other entities occupy what was referred to as the Olmsted Air Force Base. In March 1983, trichloroethene (TCE) contamination caused six of the ten onsite production wells supplying HIA to be taken out of service. Studies initiated under the Department of Defense Installation Restoration Program indicate that while groundwater contamination due to volatile organic compounds exists, the exact source(s) of contamination cannot be clearly defined. Groundwater contamination may result from one or more, possible current, sources in the 'industrial area'. To date, HIA has been able to temporarily meet the water requirements of the facility by taking the most contaminated well offline as a potable water source, and by blending potable water from a number of wells. The most prevalent contaminants of concern affecting the groundwater are VOCs including TCE and PCE. The selected remedial action for this site includes: provision of a potable water supply; construction of a central treatment plant; groundwater pump and treatment using air stripping; and groundwater monitoring. The estimated capital cost for this remedial action is $3,750,000 with annual operation and maintenance of $160,000. (Author's abstract)

ROLE OF GROUNDWATER QUALITY IN THE DECISION-MAKING PROCESS FOR WATER RESOURCES.
Universidad Politecnica de Cataluna, Barcelona (Spain). Escuela Tecnica Superior de Ingenieros de Caminos, Canales y Puertos.
E. Custodio.
IN: Groundwater Management: Quantity and Quality. Proceedings of the Symposium held at Benidorm, Spain, October 2-9, 1989. International Association of Hydrological Sciences, Washington, DC. 1989. p 87-99, 19 ref.

Descriptors: *Groundwater management, *Groundwater pollution, *Groundwater quality, *Water pollution control, *Water pollution sources, *Water quality management, *Water resources management, Aeration zone, Decision making, Forecasting, Groundwater movement, Monitoring, Saline water intrusion, Saturated zone.

The quality of aquifer water is a complex result of climatic, pedalogical, and lithological influences, modified by a set of interactions and reactions in the ground, both in the saturated and unsaturated zone. Many natural circumstances affect groundwater quality. Also man-induced changes in the flow system may alter it significantly, as is the case of seawater intrusion. Man's activities introduce an enormous variety of substances into the ground and this may lead to water contamination. The decision-making process has to consider these sources, the long transit times, the delayed and modified responses, and the difficulties involved in monitoring and forecasting. Prevention is generally more effective, feasible, and cheaper than repair and restoration. (See also W91-02672) (Author's abstract)

MANAGEMENT OF GROUNDWATER-INDUCED RIVER SALINITY DUE TO LAND CLEARING IN THE MURRAY BASIN, SOUTHEASTERN AUSTRALIA.
South Australian Dept. of Mines and Energy, Adelaide.
S. R. Barnett.
IN: Groundwater Management: Quantity and Quality. Proceedings of the Symposium held at Benidorm, Spain, October 2-9, 1989. International Association of Hydrological Sciences, Washington, DC. 1989. p 101-109, 5 fig, 1 tab, 8 ref.

Descriptors: *Groundwater management, *Groundwater quality, *Irrigation effects, *Model studies, *Recharge, *Saline water, *Surface-groundwater relations, *Water pollution control, Australia, Computer models, Drainage equilibrium, Groundwater pollution, Groundwater recharge, Land clearing, Murray River, River basin development, Saline groundwater, Vegetation effects, Vegetation regrowth, Water quality management, Water resources management, Water table rise.

Widespread clearing of native vegetation and extensive irrigation in the Murray Basin in southeastern Australia has dramatically increased recharge and caused a major change to the hydrodynamic equilibrium of the basin. The resultant rising water table has caused widespread salinization with an estimated annual cost of $100 million. Computer modeling has been used to estimate the effects on the salinity of the Murray River of the increase of saline groundwater discharge which will result from the rising water table. An increase of at least 70 EC units (70 microSiemen/cm) could occur 50 years after the water table begins to respond to the increased recharge. Selective broadscale revegetation in critical areas adjacent to the river will reduce groundwater inflows by reducing recharge, but may prove uneconomic. STOCHASTIC CONTROL OF CONTAMINANT TRANSPORT PROBLEMS.
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
R. Andricevic, and P. K. Kitanidis.
IN: Groundwater Management: Quantity and Quality. Proceedings of the Symposium held at Benidorm, Spain, October 2-9, 1989. International Association of Hydrological Sciences, Washington, DC. 1989. p 271-284, 4 fig, 1 tab, 12 ref. National Science Foundation grants CEE-8420664 and ECE-8517598.

Descriptors: *Groundwater movement, *Hydrologic models, *Model studies, *Path of pollutants, *Site remediation, *Solute transport, *Water pollution control, *Water pollution treatment, *Water quality management, Algorithms, Aquifers, Cost analysis, Mathematical models, Optimization, Parametric hydrology, Pumping, Stochastic models, Uncertainty, Water resources management.

The design of effective remediation schemes is a major technological challenge. A major difficulty is the tremendous spatial variability in the soil properties in the geological environment in which these reactions take place. Geohydrological parameters, needed for the prediction of single-phase hydrological transport and fate of contaminants, often vary over orders of magnitude within the same site. In practice there is seldom enough information to specify with certainty all the parameters of the groundwater flow and transport system. An

optimization methodology to determine the most cost-effective pumping pattern and schedule has been developed which accounts for parameter uncertainty. It shows that, in an average sense, the cost consists of two parts: one which depends only on the best estimates and another which increases with the error in parameter estimation. A policy which minimizes the sum of the two parts was developed and applied to a simple case. Comparison with an optimization method which neglects uncertainty in parameter estimation determined the superiority of the proposed algorithm. The optimal policy may be one which focuses on reducing predictive uncertainty during the initial stages. It is reasonable that the more accurate the site characterization, the more cost-effective the remediation strategy which can be designed. On the other hand, in deciding how to reduce uncertainty, one must take into account how this will improve the decontamination effort. The major advantage of the methodology developed is that it selects the solution after weighing the estimation and the control objectives, and could be used for the 'optimal sampling' problem. OPTIMAL GROUNDWATER QUALITY MANAGEMENT UNDER UNCERTAINTY: INCORPORATING THE EFFECTS OF SPATIAL VARIABILITY OF HYDRAULIC CONDUCTIVITY.
Stanford Univ., CA. Dept. of Applied Earth Sciences.
B. J. Wagner.
IN: Groundwater Management: Quantity and Quality. Proceedings of the Symposium held at Benidorm, Spain, October 2-9, 1989. International Association of Hydrological Sciences, Washington, DC. 1989. p 419-430, 5 fig, 7 ref.

Descriptors: *Groundwater management, *Groundwater movement, *Hydraulic conductivity, *Hydrologic models, *Model studies, *Path of pollutants, *Water pollution treatment, *Water quality management, *Water resources management, Aquifers, Flow models, Groundwater pollution, Solute transport, Stochastic models.

In recent years, groundwater quality management models have been developed to aid the reclamation design process. These management models combine groundwater flow and contaminant transport simulation with optimization to design for the optimal remediation of contaminated aquifer systems. Unfortunately, there are a number of potential sources of error associated with all groundwater flow and contaminant transport simulation models. Uncertainty due to spatial variability of hydraulic conductivity was explicitly incorporated into a procedure for the optimal design of aquifer remediation strategies. The management procedure is based on the stochastic approach to groundwater flow and contaminant transport modeling, in which the hydraulic conductivity is represented as a random field. The remediation design procedure begins with the solution of the stochastic inverse model. Maximum Likelihood and Gaussian conditional mean estimation are used to characterize the random conductivity field based on hydraulic conductivity and hydraulic head measurements. Next, the nonlinear groundwater quality management problem is simultaneously solved for a sampling of hydraulic conductivity realizations. An example showed that reclamation design based on as few as thirty conductivity realizations can provide reliable remediation strategies. (See also W91-02672) (Author's abstract)

FINITE ELEMENT COMBINED SURFACE WATER/GROUNDWATER MODEL FOR THE RIVER RHINE, KEHL/STRASBOURG RESERVOIR.
Lahmeyer International G.m.b.H., Frankfurt am Main (Germany, F.R.).
W. Pelka, and R. Horst.
IN: Groundwater Management: Quantity and Quality. Proceedings of the Symposium held at Benidorm, Spain, October 2-9, 1989. International Association of Hydrological Sciences, Washington, DC. 1989. p 523-532, 9 fig, 4 ref.

Descriptors: *Dam design, *Germany, *Groundwater management, *Groundwater resources, *Model studies, *Reservoir design, *Rhine River, *Surface-groundwater relations, *Water resources management, *Water supply development, Channel flow, Cost analysis, Finite element method, Flow models, Groundwater level, River basins, Three-dimensional model, Watershed management.

River engineering measures in the Upper Rhine from Basel to Strasbourg (France and Germany) were completed by putting the River Strasbourg power plant into operation. To mitigate negative environmental effects and especially to maintain a certain water level in the original river bed to support the groundwater level, a barrage was constructed. To optimize the depth of diaphragm walls of the large retarding reservoirs upstream of the barrage, a mathematical model has been developed and implemented, combining a three-dimensional finite element groundwater flow model and a finite element channel flow model. The influence of the water level in the channels on the groundwater flow is introduced by leakage boundary conditions. The reference water level of the surface water results from the channel flow model. The parameters calibrated were permeability and leakage factors for the groundwater model and roughness for the channel flow model. To maintain the required water level depth in the villages, for each diaphragm depth the cross-sections and slope of the drainage system had to be increased to a certain extent and several pump stations of varying capacity became necessary. For each diaphragm depth the costs of the expansion and correction of the drainage system were evaluated and compared with the costs of the related diaphragm wall. The optimum depth satisfying economic as well as environmental and safety requirements is about 20 m. For construction projects of this or similar dimension, the costs of even the most complicated and advanced numerical models are several orders of magnitude less than the costs which may arise without their application. ALLUVIAL AQUIFER OF THE GRAND GRAVIER (RHONE VALLEY, FRANCE) MODELLING AND PROTECTION.
Centre National du Machinisme Agricole, du Genie Rural, des Eaux et des Forets, Lyon (France).
A. Durbec, and C. Leduc.
IN: Groundwater Management: Quantity and Quality. Proceedings of the Symposium held at Benidorm, Spain, October 2-9, 1989. International Association of Hydrological Sciences, Washington, DC. 1989. p 581-593, 6 fig, 1 tab, 5 ref.

Descriptors: *Aquifer management, *France, *Groundwater management, *Groundwater resources, *Lyon, *Metropolitan water management, *Potable water, *Surface-groundwater relations, *Water pollution prevention, *Water resources management, *Water supply development, Case studies, Environmental impact, Geohydrology, Grand Gravier Aquifer, Groundwater level, Groundwater movement, Groundwater recharge, Low flow, Model studies, Numerical analysis, Path of pollutants, River basins, Urban areas, Wells.

The water supply of the entire urban area of Lyon, France, depends on groundwater. The heavy industrialization of the region generates a permanent risk of serious pollution. On the site of the Grand Gravier pumping station, especially representative of this context, a detailed hydrogeological study has allowed numerical modeling to be done of groundwater flow. Exchanges with the River Rhone have been quantified during low water flood. Direct recharge by the river exceeds 80%. Different solutions of hydraulic management have been simulated and their impact on water catchment operations predicted. A numerical model of pollutant transport permits the efficiency of sanitary protection of well fields to be tested and points out the contamination risk. The regime of the Rhone banks is currently being studied. Using the efficient methodology drawn up on this aquifer, the relationships between the Rhone and its alluvium throughout the valley can be accurately determined. The resource vulnerability will be evaluated. On the entire basin scale, scientists and politicians have to provide information to predict and to face pollution accidents, where necessary, with suitable protection measures. DRINKING WATER CRITERIA DOCUMENT FOR TOLUENE.
Environmental Protection Agency, Cincinnati, OH. Environmental Criteria and Assessment Office.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-192298. Price codes: A12 in paper copy, A01 in microfiche. EPA Final Report ECAO-CIN-408, March 1987. 267p, 20 tab, 205 ref.

Descriptors: *Drinking water, *Regulations, *Standards, *Toluene, *Water quality standards, *Water treatment, Carcinogens, Classification, Organic solvents, Public health, Toxicity, Volatile organic compounds.

Toluene is a relatively volatile organic solvent with a low water solubility, so that in aqueous solution it would be expected to evaporate into the environmental air. Because of its predisposition to exist as a vapor in the environment, most toluene exposure in humans is by inhalation. Absorption of toluene is rapid by inhalation or from the GI tract; absorption from the GI tract appears to be complete, while 50% of the inhaled toluene is absorbed through the lungs. In humans, the major effects of toluene are central nervous system dysfunction and narcosis. Applying EPA guidelines for the assessment of carcinogenic risk, toluene may be classified as group D: Not classified as to human carcinogenicity. This classification reflects the inadequate nature of the available data, thus preventing the development of a more definite statement regarding carcinogenic potential. The noncarcinogenic effects of toluene in laboratory animals and humans have been utilized for derivation of health advisories and a drinking water equivalent level (DWEL). The 1-day health advisory value, based on a human 8-hr no-observed-adverse-effect level (NOAEL), is 18 mg/L for a 10 kg child. The proposed 10-day and longer term health advisory for a 10 kg child is 3 mg/L. The longer term health advisory for a 70 kg adult adopted the DWEL of 10 mg/L as a conservative estimate of exposure. The DWEL was derived from a NOAEL for male and female F344 rats exposed to toluene by inhalation at 300 ppm for 106 wks. The resultant DWEL for toluene is 10 mg/L. (Lantz-PTT)
W91-02731

DRINKING WATER CRITERIA DOCUMENT FOR 2(2,4,5-TRICHLOROPHENOXY) PROPIONIC ACID (2,4,5-TP).
Environmental Protection Agency, Cincinnati, OH. Environmental Criteria and Assessment Office.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-192330. Price codes: A07 in paper copy, A01 in microfiche. EPA Final Report ECAO-CIN-419, September 1987. 132p, 14 tab, 120 ref.

Descriptors: *Drinking water, *Halogenated pesticides, *Herbicides, *Regulations, *Silvex, *Water quality standards, *Water treatment, Carcinogens, Organic acids, Public health, Standards, Toxicity, Water quality control.

2,4,5-Trichlorophenoxypropionic acid (2,4,5-TO), Silvex, is a commonly used systemic herbicide for both agricultural and nonagricultural purposes.

The commercial herbicide is contaminated with 2,3,7,8-TCDD, a highly toxic tetra-chlorinated dibenzo-p-dioxin. Human studies have shown some positive evidence that exposure to phenoxy herbicides together with 2,3,7,8-TCDD as a contaminant correlates with an increase in soft tissue sarcomas and non-Hodgkins lymphomas. The EPA has given this mixture of compounds a B1 weight-of-evidence ranking, which indicates that this mixture is probably carcinogenic for humans. Neither 2,4,5-TP nor 2,3,7,8-TCDD alone can, be shown to have this carcinogenic potential, however. The quantification of toxicological effects of 2,4,5-TP involved the identification of doses at which adverse health effects are anticipated for both chronic and acute exposures in adults and children consuming 2 L or L water/day. The 10-day health advisory of 0.2 ng/L (1.4 mg/day) was derived for a child exposed to 2,4,5-TP in water. A drinking water equivalent level (DWEL) of 0.26 mg/L was derived for lifetime exposure for an adult. The EPA has taken significant regulatory action on 2,4,5-TP as an herbicide product. As of February 1987, the result of the actions taken should be to reduce the availability of 2,4,5-TP, and hence its discharge into the environment, to virtually a nil level. The exception to this would be a situation where the storage of 2,4,5-TP in controlled or uncontrolled dump sites or related scenarios might result in a discharge to the environment. The regulatory action against herbicide uses began in February 1979 when 2,4,5-TP use in forestry, rights of way, pasture, home and garden, and ornamental gardening was suspended. Between 1979 and February 1985 all other registrations for 2,4,5-TP uses were cancelled by the US EPA. From February 1985 through February 1986, existing 2,4,5-TP stocks only were allowed into commerce only for highly limited use. As of February 1986 all sales of 2,4,5-TP ceased. (Lantz-PTT)

RINKING WATER CRITERIA DOCUMENT OR TOXAPHENE.
nvironmental Protection Agency, Cincinnati, H. Environmental Criteria and Assessment ffice.
vailable from the National Technical Information rvice, Springfield, VA 22161, as PB89-192306. ice codes: A07 in paper copy, A01 in microfiche. PA Report ECAO-CIN-426, February 1987. 8p, 29 tab, 216 ref.

escriptors: *Carcinogens, *Drinking water, *Halenated pesticides, *Regulations, *Standards, oxaphenes, *Water quality standards, *Water atment, DDT, Insecticides, Lethal limit, Organcompounds, Public health, Toxicity.

xaphene is a broad spectrum, chlorinated terioid pesticide introduced in the US as a contact ecticide in 1948. Together with methoxychlor, xaphene has been the chief replacement for DT when the use of DDT was banned. A varieof guidelines or standards have been published protect against toxaphene in aquatic media. That ional interim primary drinking water standard is nicrogm/L. The FDA mandated level for bot- water is also 5 microgram/L. These standards based upon organoleptic effects. The water lity criterion for the protection of human health s originally set at 0.5 microgram/L for a 0001 cancer risk level. This criterion was subsently revised to 7.1 ng/L for a risk of 0.00001. If sumption of aquatic organisms is considered ne, the corresponding risk level is 7.3 ng/L. xaphene has caused convulsions and nausea in nans when exposure has occurred by ingestion, contact or inhalation. The acute oral LD50, mated from accidental poisonings was found to y between 29 and 100 mg toxaphene/kg body ght. Mixtures of toxaphene with DDT (2:1, by ght) are more acutely toxic than either compot alone. The recommended criterion for chronxposure to toxaphene in drinking water, not sidering intake from other sources, is 3.1, 0.31 0.031 micrograms/L to maintain individual cer risk less than 0.0001, 0.00001, and 0.000001, pectively. The sufficient level of carcinogenic dence in experimental animals, together with inadequate level of human evidence meets the RC Group 2B criteria for weight of evidence that a chemical is likely to be a human carcinogen. The assignment of a Group 2B designation by IARC means that the chemical is probably carcinogenic in humans. (Lantz-PTT)

EC BATHING WATERS DIRECTIVE AS APPLIED TO SCOTLAND.
Forth River Purification Board, Edinburgh (Scotland).
W. Halcrow, and T. M. Leatherland.
Journal of the Institution of Water and Environmental Management JIWMEZ, Vol. 4, No. 4, p 356-360, August 1990. 3 tab, 7 ref.

Descriptors: *Bacteria, *Recreation, *Regulations, *Scotland, *Swimming, *Wastewater disposal, *Water quality, Coliforms, Monitoring, Ocean dumping, Outfall sewers, Standards, Wastewater outfall, Wastewater pollution, Water quality control.

Monitoring of the bacteriological quality of potential bathing waters has been carried out in Scotland since the publication of the EC bathing waters Directive 14 years ago. However, it has only been since 1987 that 23 beaches in Scotland have been officially recognized as having bathing waters which should meet the environmental quality standards (EQS) laid down by the Directive. Results of the first three years' monitoring are outlined and the cost of this work has been estimated. Treatment of effluents through solids removal, trade effluent control at source, and dispersion from a long sea outfall is the most appropriate form of sewage disposal in the majority of coastal situations. All future coastal sewage disposal schemes should be sited so as to make provisions for additional works to meet possible new standards. The need to monitor both indicator and target organisms is questioned, and studies are cited suggesting that the present mandatory coliform standards may not be sufficiently stringent. (Lantz-PTT)

EUROPEAN ENVIRONMENTAL DIRECTIVES--IMPLICATIONS FOR NORTHERN IRELAND.
D. R. Saville.
Journal of the Institution of Water and Environmental Management JIWMEZ, Vol. 4, No. 4, p 379-385, August 1990. 9 tab, 8 ref.

Descriptors: *Economic aspects, *Northern Ireland, *Regulations, *Waste disposal, *Water quality, Compliance, Drinking water, Municipal wastewater, Ocean dumping, Outfall sewers, Recreation, Swimming, Wastewater outfall, Wastewater treatment, Water quality control.

The current level of compliance in Northern Ireland with the European Community (EC) Directives on drinking water quality, bathing water quality, sewage sludge to land and the draft Directive on the disposal of sewage sludge to the sea, is discussed. The cost implications of full compliance are examined, taking account of works already programmed, and concluding that additional funding will be required over the next ten years amounting to almost 250 million pounds. A large portion of this sum will be required for improvements relating to the drinking water directive. Compliance with the Directives are compulsory. A description of the increase in estimated additional funding to approximately 440 million pounds, due to general inflation and other factors, is included. These other factors include: the new draft municipal wastewater treatment Directive, together with the March 1990 announcement by the UK Environment Minister committing the UK to the cessation of sewage sludge dumping at sea, and the provisions of sewage treatment for coastal outfalls. LACK OF THEORETICAL BASIS FOR PREDICTING RATE AND PATHWAYS OF RECOVERY.
Virginia Polytechnic Inst. and State Univ., Blacksburg. Center for Environmental and Hazardous Material Studies.
J. Cairns.
Environmental Management EMNGDC, Vol. 14, No. 5, p 517-526, 1990. 1 tab, 32 ref.

Descriptors: *Habitat restoration, *Lotic environment, *Rehabilitation, *Stream improvement, *Water pollution treatment, Ecology, Ecosystems, Prediction, Running waters, Theoretical analysis.

An inadequate basis for precisely predicting the outcome of lotic ecosystem recovery, whether due to unaided natural processes or management techniques or both, exists because: (1) the field of ecology has not yet matured as a rigorous predictive science; (2) the precise sequence of events, including climatic occurrences, affecting the recovery process may be unique events and thus rarely or never repeated; and (3) even when attempts are made to control the recolonization process through introduction of species and such, the interaction of these species may not follow deterministic models. Lotic ecosystems are influenced strongly by exports from the surrounding land mass and, under certain circumstances, this may be the overriding influence on the recovery process. Therefore, unless the boundary conditions are determined realistically, the recovery process may not follow desirable pathways. Despite the lack of a robust theoretical support base for lotic ecosystem recovery, some remarkable and rapid recoveries have occurred to either a close approximation of the original condition or to a condition ecologically superior to the damaged condition. In some cases, the recovery was due entirely to natural processes and often followed relatively straightforward management practices. There is evidence indicating that lotic ecosystem restoration is both cost-effective and likely to produce satisfying results fairly rapidly. It is both fortunate that this is the case, since society is likely to support such efforts when the results have been extraordinarily successful, and unfortunate since restoration ecology needs a predictive capability. (Author's abstract)

INDICATORS OF ECOSYSTEM RECOVERY.
Cornell Univ., Ithaca, NY. Ecosystems Research Center.

J. R. Kelly, and M. A. Harwell.
Environmental Management EMNGDC, Vol. 14, No. 5, p 527-545, 1990. 5 fig, 4 tab, 46 ref. Cornell University and EPA Cooperative Agreement No. CR81268501.

Descriptors: *Bioindicators, *Ecosystems, *Lotic environment, *Monitoring, *Rehabilitation, *Stream improvement, *Surveys, Data acquisition, Ecological effects, Streams, Stress.

The assessment of ecological changes relative to disturbance, either natural or human induced, confronts a fundamental problem. Ecosystems are complex, variable and diverse in nature; consequently, the need for simplification to essential features that would characterize ecosystems adequately, is generally acknowledged. Yet there is no firm prescription for what to measure in order to describe the response and recovery of ecosystems to stress. Initial focus is provided by identifying relevant ecological endpoints, such as ecological changes of particular relevance to humans. Furthermore, it is suggested that generic purposes and criteria be considered when making choices for ecological indicators that relate to those endpoints. Suites of indicators, with a variety of purposes, are required to assess response and recovery of most ecosystems and most stresses. Measures of certain ecosystem processes may provide special insight on the early stages of recovery; the use of functional indicators as complimentary to other biotic indicators is highlighted in an extended example for lotic ecosystems. (Author's abstract)

RECOVERY OF LOTIC COMMUNITIES AND ECOSYSTEMS FROM DISTURBANCE--A NARRATIVE REVIEW OF CASE STUDIES.
Environmental Research Lab., Duluth, MN.
J. D. Yount, and G. J. Niemi.
Environmental Management EMNGDC, Vol. 14, No. 5, p 547-569, 1990. 170 ref.

Descriptors: *Case studies, *Ecosystems, *Habitat restoration, *Lotic environment, *Rehabilitation, *Stream improvement, Ecological effects, Flushing, Life history studies, Literature review, Restoration, Stream biota, Water quality.

A narrative account is given of case studies of the recovery of flowing water systems from disturbance, focusing on conclusions about recovery time and the factors contributing to recovery. Attention is restricted to case studies in which the recovery of some biological property of the system has been examined, excluding those that deal only with physical or chemical properties. Although natural processes and rates of recovery are emphasized, studies of restoration or reclamation of damaged ecosystems are included where they contribute to an understanding of recovery processes. For the majority of studies examined, the systems recovered quite rapidly. The most commonly cited reasons for short recovery times were: (1) life history characteristics that allowed rapid recolonization and repopulation of the affected areas; (2) the availability and accessibility of unaffected upstream and downstream areas and internal refugia to serve as sources of organisms for repopulation; (3) the high flushing rates of lotic systems that allowed them to quickly dilute or replace polluted waters; and (4) the fact that lotic systems are naturally subjected to a variety of disturbances and the biota have evolved life history characteristics that favor flexibility or adaptability. In general, longer recovery times were observed in disturbances, such as channelization, that resulted in alterations to physical conditions. This review also indicates that much of the knowledge of recovery in lotic ecosystems is fragmented and uncoordinated. In addition to establishing the bounds of recovery time, this review identifies some research gaps that need to be filled. (Author's abstract)

OVERVIEW OF CASE STUDIES ON RECOVERY OF AQUATIC SYSTEMS FROM DISTURBANCE.
Minnesota Univ.-Duluth. Natural Resources Research Inst.
G. J. Niemi, P. DeVore, N. Detenbeck, D. Taylor, and A. Lima.
Environmental Management EMNGDC, Vol. 14, No. 5, p 571-587, 1990. 9 fig, 14 tab, 39 ref.

Descriptors: *Aquatic environment, *Case studies, *Ecosystems, *Habitat restoration, *Rehabilitation, *Stream biota, *Water pollution effects, DDT, Ecological effects, Fish, Literature review, Lotic environment, Macrophytes, Periphyton, Phytoplankton, Streams, Stress, Water quality.

An extensive review of the published literature identified more than 150 case studies in which some aspect of resilience in freshwater systems was reported. Approximately 79% of systems studied were lotic and the remainder lentic. Most of the stressor types were chemical with DDT (N = 29) and rotenone (N = 15) the most common. The most common nonchemical stressors were logging activity (N = 16), flooding (N = 8), dredging (N = 3), and drought (N = 7). The variety of endpoints to which recovery could be measured ranged from sparse data for phytoplankton (N = 13), periphyton (N = 6), and macrophytes (N = 8), to relatively more data for fish (N = 412) and macroinvertabrates (N = 698). Unfortunately the same characteristics were rarely measured consistently among sites. For example, with respect to fish, more than 30 different species were studied and recovery was measured in many ways, most commonly on the basis of: (1) first reappearance of the species, (2) return time of predisturbance densities, and (3) return time of predisturbance average of individual size. Based on these criteria, all systems in these studies seem to be resilient to most disturbances with most recovery times being less than 3 years. Exceptions included when: (1) the disturbance resulted in physical alteration of the existing habitat; (2) residual pollutants remained in the system; or (3) the system was isolated and recolonization was suppressed. APPLIED LAND CLASSIFICATION FOR SURFACE WATER QUALITY MANAGEMENT: I. WATERSHED CLASSIFICATION.
National Chunghsing Univ., Taichung (Taiwan). Graduate Inst. of Urban Planning.
S. L. Huang, and J. J. Ferng.
Journal of Environmental Management JEVMAW, Vol. 31, No. 2, p 107-126, September 1990. 4 fig, 8 tab, 33 ref. National Science Council, Executive Yuan of the Republic of China (Grant No. NSC77-0301-H005-03Z).

Descriptors: *Land classification, *Land use, *Taiwan, *Water quality management, Classification, Land management, Model studies, Multivariate analysis, Spatial distribution, Water pollution effects, Watersheds.

A land classification scheme for water quality management was developed for the Tanshui River Basin, Taiwan, using the watershed as the basis for classification. Seventy-eight third order watersheds were grouped into five watershed zones representing varied assimilative capacities and relative societal properties of water quality management. Multivariate techniques (factor analysis, cluster analysis, and discriminant analysis) were used for this purpose. The results indicate that the detection of spatial patterns having ecological significance is possible through multivariate techniques. Also, the assimilative capacity and potential effects of pollution due to inadequate land measurement can be assessed through the incorporation of watershed characteristics such as topography, soil, land cover, etc. The significance of this study is its potential usefulness for integrating land and water quality management. APPLIED LAND CLASSIFICATION FOR SURFACE WATER QUALITY MANAGEMENT: II. LAND PROCESS CLASSIFICATION.
National Chunghsing Univ., Taichung (Taiwan). Graduate Inst. of Urban Planning.
S. L. Huang, and J. J. Ferng.
Journal of Environmental Management JEVMAW, Vol. 31, No. 2, p 127-141, September 1990. 6 fig, 2 tab, 21 ref. National Science Council, Executive Yuan of the Republic of China (Grant No. NSC77-0301-H005-03Z).

Descriptors: *Land classification, *Numerical analysis, *Taiwan, *Water pollution sources, *Water quality management, Classification, Land management, Land use, Soil erosion, Surface runoff, Surface water, Watersheds.

A land process classification system was developed through assessment of sensitive areas for management of water quality in the Tanshui River Basin, Taiwan. A grid approach was used to identify environmentally sensitive areas for the control of non-point sources of pollution. Surface runoff, surface erosion, and distance to stream were used as variable inputs for taxonomic classification. Using a numerical approach, the Tanshui River Basin was divided into four land classes which represented various sensitivities of land resource effects on water quality. The approach and results demonstrated in this study refined the spatial variation of land characteristics within a classified watershed area and also revealed the interrelationships between watershed characteristics and water quality through land process responses. The classification scheme can serve as a basis for local land use control to minimize adverse effects on surface water resulting from incompatible land uses and inadequate land management practices. Land use performance can also be established according to the sensitive characteristics of each class zone. (See also W91-02947) (Medina-PTT)

STATE OF THE CHESAPEAKE BAY.
G. B. Mackiernan.
Water Environment & Technology WAETEJ, Vol. 2, No. 9, p 60-67, September 1990. 4 fig

Descriptors: *Administrative agencies, *Aquatic habitats, *Chesapeake Bay, *Ecosystems, *Estuaries, *Water pollution, *Water resources management, Algal growth, Anadromous fish, Anoxia, Bays, Biomass, Degradation, Governmental interrelations, Hydrocarbons, Submerged plants, Trace metals, Wastewater disposal.

Chesapeake Bay, the largest estuary in the USA, is a system under threat as a result of population growth and development in the area, alteration of habitats, and discharge of pollutants. Prompted by public concern, the U.S. Environmental Protection Agency (EPA) undertook a study of this troubled estuary in 1977. In 1983, the EPA released reports of widespread ecosystem degradation and warned that trends would continue as development increased unless effective management actions were implemented. The reports concluded that much of the bay was overenriched with nitrogen and phosphorus; levels of chlorophyll a found in algal biomass were increasing in most regions; the volume of water exhibiting hypoxia or anoxia had increased significantly in the preceding 30 years; elevated levels of trace metals and polyaromatic hydrocarbons were present in water, sediments, and in the tissue of bay organisms; there had been an unprecedented bay-wide loss of submerged vegetation; landings of anadromous finfish and oysters had declined significantly; and there were accompanying failures of recruitment in many species. These findings and subsequent recommendations led to the establishment of a federal and state Chesapeake Bay Restoration Program, linking Maryland, Virginia, Pennsylvania, and the District of Columbia in an effort to improve and protect the water quality and living resources of the Chesapeake Bay estuarine system. The initial agreement in 1983 outlined actions to reduce nutrient input, control toxic materials, and to enhance bay species and their habitats. A cooperative bay-wide monitoring program was also initiated to evaluate environmental trends and to track progress. In 1987, specific commitments and deadlines were established including a basin-wide 40 reduction of both P and N from both point and nonpoint sources by the year 2000; reduction of inputs of toxicants bay-wide, consistent with the 1987 Water Quality Act; and restoration, protec

ion, and enhancement of fishery resources and abitats. (Medina-PTT)

apid development and population surge in the ashington D.C. area in recent years have caused creased water-quality degradation in the Poto-ac River, one of the areas's major water bodies. ue to elevated bacterial levels and the danger of tching water-borne diseases, the U.S. Public ealth Service, as early as 1925, declared the otomac River unsafe for swimming. The greatest ater-quality concerns were centered on the sec-n of the Potomac flowing through the metropol-n area which receives the greatest volume of gional wastewater discharges. This caused nox-us algae blooms, high bacterial counts, and very w dissolved oxygen (DO), noticeable during the mmer months. However, today, the low DO els have essentially disappeared, and submerged getation has reappeared and spread, reflecting tremendous progress made during the mid 70s and 1980s. Recreational fishing has returned d summer bacterial levels have begun to approx-ate the established water-quality standards. Peri-c violations of bacterial standards occur be-se of untreated combined sewer outflows and npoint source runoff during heavy rains. An mate is also given for the operational cost and grading of these Virginia treatment plants by the r 2000. (Medina-PTT)

SOURI RIVER MANAGEMENT PROJECT: RNING TO COOPERATE.
Smith.
Indian Water Rights and Water Resources agement. Proceedings of a Symposium. Amer-Water Resources Association, Bethesda, yland. 1989. p 11-19.

riptors: *Governmental interrelations, *Indian r rights, *Missouri River, *Regional planning, ter resources management, *Water rights, ter use, Competing use, Federal jurisdiction, n reservations, Riparian rights, State jurisdic-

century has brought phenomenal change to Missouri River. Six mainstem dams, operated by the Army Corps of Engineers, have been constructed in its upper reaches for flood control and commercial navigation. Other than the annual adoption of an operating plan by the Corp of Engineers, there is little attempt being made by the basins citizens, Indian tribes, states and federal government, to coordinate and plan for the basin's future. Basin water allocation issues which involve Indian reserved water rights and industrial marketing of water, have made their way to the US Supreme Court twice in the last two years. The dearth of the Missouri River Basin coordination and planning has motivated the Northern Lights Institute, located in Montana, to initiate in 1985, the Missouri River Management Project. This project, now in its fourth year, seeks to democratically involve the basin's three sovereigns and its citizenry in a cooperative approach to reshape river management policies to reflect contemporary public values in a manner that is compatible with the riparian environment. Through this project, it has been found that the fundamental deterrent to sound water management in the Missouri River Basin is a lack of trust and cooperation. (See also W91-02262) (Lantz-PTT)

Better options are, in part, a function of the analytical framework that is brought to resource management. Neoclassical economics has been used to structure cost-benefit analysis of water projects. Rules based on related financial concepts limit the degree of subsidy. Very different results in the formulation and evaluation of projects appear likely if concepts from institutional economics are applied as a supplement to those based solely on more conventional economics. In particular, the differences in the Anglo and Indian cultures can be more explicitly taken into account. The results may make water projects more effective instruments for capacity building. Concepts of instrumental efficiency compliment the conventional economic and financial concepts and provide conceptual limits for the adjustment of the rules based on those conventional concepts. The results may have application to subsets of the non-Indian society as well. (See also W91-02262) (Author's abstract)

Descriptors: *Alternative planning, *Groundwater management, *Hydrologic models, *Model studies, *Planning, *Water quality management, *Water resources management, Analytical methods, Cropland, Marsh management, Policy making, Water policy, Water supply development.

In the Netherlands a national integral water management program controls both groundwater and surface water management with all their aspects. A complex system of instruments has therefore been developed including an instrument for groundwater management. This recently-developed instrument was used in a background analysis of management alternatives. Three causes of drying up of crops and vegetation in the Drenthe Plateau were analyzed: (1) extraction of wells, (2) polder level manipulations in the valleys, and (3) changes in the drainage resistance in the valleys. It appeared that all three cause important effects stretched out over large domains, but at different places and with different magnitudes. One of the scenarios for regeneration of wet nature domains suggested reallocation of wells. Because the groundwater model is based on the analytical element method, it meets the requirements for flexibility in the use of scales and for nationwide comparability of the results. Effects on groundwater of the alternatives concerning large domains can be presented in a clear and accurate way to policymakers. (See also W91-02672) (Fish-PTT)

STREAMSIDE MANAGEMENT UNITS IN THE PACIFIC NORTHWEST.
Forest Service, Portland, OR. Pacific Northwest Region.
G. W. Swank.
Forest Ecology and Management FECMDW, Vol. 33/3, No. 1/4, p 419-424, June 1990. 1 tab.

Descriptors: *Forest ecosystems, *Forestry, *Forests, *Oregon, *Riparian areas, *Streamside Management Unit, *Washington, *Water quality, *Water quality management, Fisheries, Management planning, Resources management, Riparian waters, Streams.

The riparian areas in the Pacific Northwest are an extremely important social, economic, and environmental part of the Regional and National Forest land base. These multi-use sites, however, support fish-bearing streams, lakes and resevoirs, wetlands and floodplains, wildlife habitats, recreational sites, cow and sheep forage, and timber production which often compete with each other. The Streamside Management Unit (SMU) Policy in the National Forests of Oregon and Washington addresses one of these concerns--the water quality and fisheries including the area in and immediately adjacent to streams. The SMU concept is a stream classification system based on water use with specific water quality objectives established for each of the four classes of streams. The underlying premise is that the land immediately adjacent to streams is the key to protecting water quality. Through the use of SMUs, this land can be effectively monitored and managed not only to protect the riparian habitats but also, in most cases, to retain a reasonable return on other resource values. Water Environment & Technology WAETEJ, Vol. 2, No. 10, p 71-76, October 1990. 8 tab.

Descriptors: *Management planning, *Project planning, *Reclaimed water, *Water reuse, *Water supply development, Data requirements, Potable water, Public participation, Texas, Water quality standards, Water resources data, Water resources management, Water treatment.

A four-phase planning effort was used in the development of a water reclamation/reuse project initiated in 1988 to indirectly augment potable water supplies for Abilene, TX, by increasing the flows into the surface water supply reservoir. The four work phases focused on project definition and formation, creation of baseline data, treatment process evaluation and selection, and implementation. Under this management approach, each phase is nearly independent, with distinct orientation meetings and schedules. Phase 1 involves formation of the project team, including a public advisory committee (PAC), and requires the project to develop, in detail, the specific goals and objectives of the project. In Phase 2, the project team compiles fact sheets of relevant baseline information on a specific subject. Because available data may be incomplete or of questionable validity, supplemental data should be acquired. In Phase 3, fundamental technical information is developed. Water quality standards are identified, computer modeling is conducted to determine the impact of the standards on the receiving water, and treatment alternatives are developed and evaluated. By the onset of Phase 4, the major technical memoranda are completed and the project team should be ready to draft the summary report. At this stage, estimated costs should be considered in planning budget estimates. The water quality monitoring program should be continued through Phase 4 to provide data needed to evaluate the impact of the reuse improvements. Financing options for a reclamation project are similar to those for conventional wastewater treatment systems. In addition, the development of a public information and acceptance program (for reused water) should begin with the study and continue throughout the implementation phase. (VerNooy-PTT)

ESTIMATED DEMAND FOR AGRICULTURAL WATER FOR USE IN NEW JERSEY, 1990.
Geological Survey, Trenton, NJ. Water Resources Div.
E. O. Titus, R. M. Clawges, and C. L. Qualls.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 90-156, 1990. 53p, 2 fig, 12 tab, 6 ref.

Descriptors: *Drought, *Hydrologic budget, New Jersey, *Soil moisture deficiency, *Water use, Agricultural water, Irrigation water.

As part of an effort to determine if an adequate supply of agricultural water for irrigation use will be available to farmers, the U.S. Geological Survey prepared preliminary estimates of demand for agricultural water for irrigation use for the year 1990 on the basis of six possible scenarios. These scenarios incorporate normal and drought climatic conditions and three alternative estimates of the total acreage of farmland that may be irrigated in 1990. Preliminary estimates of water demand based on soil-moisture deficits were made using methods for calculating climatic water budgets. These estimates ranged from 3.0 billion gal/growing season (May through September), under normal climatic conditions and a 2% annual decline in irrigated acreage since 1984, to 28.9 billion gal/growing season, under drought conditions and a 2% annual increase in irrigated acreage since 1984. Preliminary estimates of water demand made for the 1986 growing season reasonably approximate reported water use for that period. (USGS)

SALMON AND THE SNAKE: MEETING FISH FLOW OBJECTIVES IN A SEMI-ARID RIVER BASIN.
Watershed Resources, Inc., Santa Fe, NM.
J. Tolisano.
In: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 175-186, 1 fig, 23 ref.

Descriptors: *Competing use, *Fish migration, *Fisheries, *Indian water rights, *River flow, *Salmon River, *Snake River Basin, *Water resources management, Hydroelectric powerplants, Idaho, Irrigation, Water resources development, Water use.

The primary uses of water in the upper Snake River basin in Idaho are for irrigation and hydropower production. Present water resource management strategies in the basin have emphasized these users to the detriment of other resources, especially anadromous fish. In the era before water resources development, anadromous fish were carried to the ocean during the juvenile life phase by the relatively high flows of the spring and summer natural runoff, completing the journey in as little as 4 days. Migration can now take more than 1.5 months with resultant significant mortalities. An analysis of the hydrology and water use characteristics within the basin indicates that more than 3 million acre-feet (MAF) of additional water could be made available for anadromous fish migrations, especially during the critical juvenile out-migration period, without curtailing existing uses. These opportunities for improved flows for fish include new storage and changes to existing operations for reservoir releases, irrigation diversions, and water rights transfers in Idaho. MAYA UTILIZATION OF KARST GROUNDWATER RESOURCES.
Pennsylvania State Univ., University Park.
G. Veni.
Environmental Geology and Water Sciences EGWSEI, Vol. 16, No. 1, p 63-66, 1990. 11 ref.

Descriptors: *Groundwater management, *History, *Karst hydrology, *Life history studies, *Water resources development, *Water resources management, Belize, Caves, Groundwater pollution, Guatemala, Honduras, Mexico, Semiarid lands, Springs, Surface water availability.

Much of the Maya civilization in pre-Columbian Meso-America was established on karst terrain that included parts of what are now Belize, Guatemala, northern Honduras and southern Mexico. By definition, little surface water exists in karst, so for the Maya to flourish on that terrain they had to effectively and efficiently utilize all their water resources. Access to groundwater was by means of springs and caves. Maya life, urban and rural, lay and elite, religious and secular, was often a function of groundwater exploitation and surface water development. The Maya's use of groundwater was predominantly to supplement enhanced surface water supplies and was used more often in semiarid zones than in humid zones. The pattern of Maya settlements, especially in the semiarid zones, occurred in areas with greater access to the groundwater. Maya groundwater retrieval methods were primitive, inefficient, labor intensive, and uninnovative, as compared to their other technologic achievements. Groundwater contamination, from human effluent, could have resulted in widespread disease and contributed to the Maya's downfall. (Author's abstract)

PRETEST ANALYSES OF WATER DEMAND IN THIRTY COMMUNITIES.
Texas A and M Univ., College Station. Dept. of Agricultural Economics.
R. C. Griffen, and C. Chang.
Water Resources Research WRERAQ, Vol. 26, No. 10, p 2251-2255, October 1990. 2 fig, 6 tab, 24 ref.

Descriptors: *Pricing, *Texas, *Water costs, *Water demand, *Water use, Capital costs, Climates, Model studies, Seasonal variation, Sewage rate, Water rates.

Using three years of monthly data for 30 carefully selected Texas communities, several characteristics of community water demand, including pricing structures, are investigated using a demand model containing six variables: per capita residential and commercial water consumption, average price of water paid by an average 2.84 person household, marginal price of water paid by an average 2.84 person household, annual personal income per capita, percent of the population with Spanish origin, and a climate variable. Average price versus marginal price specifications demonstrate the superiority of the average price approach. More original contributions identify the need to include sewer rates in water demand models, the importance of studying seasonal demand rather than annual demand, seasonal variations in the price elasticity of demand, and an index for relating monthly community water demand to monthly climatic conditions. Results clearly indicate summer price elasticities which are about 50% higher than winter elasticities. Coupled with the fact that capital expenditures to create peak load capacities represent a large proportion of utility costs, time of year rates are favored. (Brunone-PTT)

INDIAN WATER RIGHTS AND WATER RESOURCES MANAGEMENT.
Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. 188p. Edited by William B. Lord and Mary G. Wallace.

Descriptors: *Indian reservations, *Indian water rights, *Legal aspects, *Symposium, *Water law, *Water rights, Administration, Competing use, Social aspects, Water resources management, Water use.

Indian water rights have come to be one of the Nation's most important water resource issues. Indian water rights claims are presently being adjudicated in almost every Western state. These claims are usually very senior and also unquantified. How these claims will be satisfied will affect water use and management in most of the West. The parties affected by these conflicts have different objectives. Tribes look to securing and using water rights as a major hope for achieving self-sufficiency, furthering tribal sovereignty, and maintaining cultural pluralism. Non-Indian water users seek to safeguard long established water uses and remove uncertainties about future water entitlements. States wish to assert state responsibility and authority for water allocation and to preserve the integrity of state water laws and administrative systems. The federal government has many interests, ranging from its trust responsibilities to Indian tribes through such specific responsibilities as environmental protection, and fulfilling commitments to users of federal project water, to its general responsibility to minimize the financial burdens placed upon the Nation's taxpayers. Resolving Indian water rights conflicts within this context of

multiple aspirations and viewpoints has been extremely difficult. Litigation has produced very few settlements, and negotiation and legislation have been only slightly more successful. All parties share a common interest in finding better and more lasting ways of settling these disputes. The purpose of this symposium is to assess the collective experience in resolving Indian water rights conflicts, to examine all possibilities for solutions, and to forge new conceptual bases for moving from the win-lose situations which preclude easy settlement to win-win situations from which all can benefit. INDIAN WATER CLAIMS NEGOTIATIONS: CONFLICTING FEDERAL ROLES.
Department of the Interior, Washington, DC. Office of Program Analysis.
B. Simon.
IN: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 1-10, 1 tab, 6 ref.

Descriptors: *Conflicting use, *Federal jurisdiction, *Indian reservations, *Indian water rights, *Legal aspects, *Water rights, Political aspects, Water law, Water resources management.

In recent years the Federal government has attempted to negotiate rather than litigate Indian water claims, and has found that negotiations are not a panacea. To obtain effective settlements, the Government needs to take full advantage of all available mechanisms (including litigation) for settling Indian water claims. But there are cases that are well suited to negotiations. Much of the success of the negotiation process depends on the effectiveness of the Federal government, a major player in all Indian water rights negotiations. Past negotiations have shown that: (1) effective negotiations require solid organization with high level support from political leadership. If high level support is lacking, Federal negotiators are at a decided disadvantage in any negotiation; (2) even if all ideal conditions are present, the Federal government can be expected to appear indecisive at times because it is subject to internal conflict; and (3) important precedents concerning federal financing of settlements and protection of existing water users have been established by the cases settled during the last 6 years which can be used as a base of guidance for future negotiations. INDIAN WATER RIGHTS SETTLEMENTS: THE ROLE OF LOCAL REPAYMENT AND OPERATING ENTITIES RESPONSIBLE FOR FEDERAL RECLAMATION PROJECTS.
Central Arizona Water Conservation District, Phoenix.
D. K. Miller.
IN: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 21-31, 2 fig.

Descriptors: *Cost allocation, *Federal jurisdiction, *Indian reservations, *Indian water rights, *Legal aspects, *Water resources management, *Water rights, Competing use, Costs, Economic aspects, Land reclamation, Salt River Pima-Maricopa Indian Community.

The role of the repayment contractor and operator of a major federal reclamation project, in the negotiation and settlement of a significant Indian Water Rights claim was examined. The example used is the settlement of the water rights claims of the Salt River Pima-Maricopa Indian Community, recently authorized by Congress. In this case, the Central Arizona Water Conservation District (CAWCD) participation in the settlement process established an important principle of consultation. Repayment and operating agencies responsible for federal reclamation projects must determine their appropriate role in Indian water rights negotiations and the extent to which their resources should be devoted to the settlement of Indian water rights claims. If participation is judged to be appropriate, the agencies must then evaluate the impact of the settlement on: (1) project water supplies; (2) project water users; (3) system capacity; (4) project power supplies; (5) operation, maintenance and repair costs; and (6) the repayment of project costs. Vigorous and sustained participation in settlement negotiations will be necessary to protect the agency's interests. Frequent consultation among staff of the agency, its governing body, and its water users concerning the progress of negotiations will be required in order to avoid mistakes and to gain political support for eventual compromises. WATER TRANSFERS AND PAPER RIGHTS IN THE TRUCKEE AND CARSON RIVER BASINS.
Environmental Defense Fund, Oakland, CA.
D. Yardas.
IN: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 33-42, 2 fig, 1 tab, 31 ref.

Descriptors: *Carson River Basin, *Conflicting use, *Indian water rights, *Legal aspects, *Truckee River Basin, *Water resources management, *Water rights, *Water transfer, *Water use, Indian reservations, Pyramid Lake, Regulations, Wetlands.

Federal regulatory actions in Nevada's Truckee and Carson River Basins have resulted in a painful environmental choice between water for Pyramid Lake and water for the Stillwater and other Lahontan Valley wetlands. Water rights acquisitions have become a leading policy alternative in efforts to avoid this environmental tradeoff, the roots of which can be found in turn-of-the-century reclamation efforts which ignored the needs of both resources. Recent and contemplated acquisitions involving 'inactive' water rights threaten to perpetuate the conflict, however, while attempts to limit such purchases are frustrated by unresolved legal and equity issues over the status of inactive entitlements. An overview of the controversy, including the disparate interests of Newlands Project farmers and the Pyramid Lake Paiute and Fallon Paiute-Shoshone Tribes, illuminates the importance of developing an acquisition oriented activity standard that is cognizant of those claims. If water rights acquisitions are to diffuse the environmental conflicts, however, an activity standard must come into play. (See also W91-02262) (Author's abstract)
W91-02266

TRANSACTION COSTS AND RESOLUTION OF RESERVED RIGHTS CLAIMS.
Utah State Univ., Logan. Dept. of Economics.
D. L. Snyder, and J. C. Andersen.
IN: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 43-52, 8 ref.

Descriptors: *Competing use, *Cost-benefit analysis, *Costs, *Indian water rights, *Legal aspects, *Water rights, Economic aspects, Feasibility studies, Water resources management.

Transaction costs are an important consideration in transferring resources among competing uses. This concept is particularly relevant in the case of reserved water rights. Beginning with Winters vs. US in 1906, the US Supreme Court has consistently ruled that water rights exist on federal reservations consistent with the purpose for which each reservation was established. While ruling that such rights existed, the Court did not provide any usable means whereby those rights could be quantified. However, a basis for quantification has emerged in subsequent cases; that of Practicably Irrigable Acreage or PIA. An essential element of PIA is economic feasibility as measured by a cost-benefit ratio greater than one. Considerable controversy and transaction costs surround the application of PIA and economic feasibility as applied to the quantification of reserved water rights. The use of economic feasibility, however, as a decision rule encourages abuse of the economic concepts, and methods of analysis become subject to distortion and bias. The real implications of the application of economic feasibility have either not been addressed by those involved or have been ignored. As long as the implications are ignored, little useful information can be derived from any analysis of economic feasibility. (See also W91-02262) (Lantz-PTT)

STATE GOALS IN INDIAN WATER RIGHTS DISPUTES.
P. W. Sly.
IN: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 63-71.

Descriptors: *Governmental interrelations, *Indian reservations, *Indian water rights, *Legal aspects, *State jurisdiction, *Water resources management, *Water rights, Federal jurisdiction, Institutional constraints, Regulations.

State goals in Indian water rights litigation and legislation fall within four general areas: (1) regulatory and adjudicatory simplicity, (2) protection of state proprietary and fiscal interests, (3) protection of water rates based on state law against rights based on federal law, and (4) interstate goals. All states seek regulatory simplicity and predictability. Some are pursuing relative certainty by direct negotiation with Indian tribes. State proprietary and interstate interests are site specific, depending on the hydrology of each reservation and affected non-Indian areas. State 'representative federalism' against Indian rights depends on hydrology, population and landholding patterns within and near reservations, and the water institutions within the state. The strong state interest in certainty of rights to a limited water resource has led states to explore negotiation with Indian tribes. Ultimate self-determination for states and tribes may be best served by negotiations which can tailor an agreement to meet existing needs without the costs, friction and delay of litigation. NON-INDIAN WATER USERS' GOALS: MORE IS BETTER, ALL IS BEST.
Jennings, Strouss and Salmon, Phoenix, AZ.
J. B. Weldon.
IN: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 73-85.

Descriptors: *Indian reservations, *Indian water rights, *Legal aspects, *Water resources management, *Water rights, *Water use, Competing use, Public policy, Water demand.

The doctrine of prior appropriation has governed water use by non-Indians in most Western states for over a century. Under the doctrine, a water user is entitled to that amount of water which the water user has diverted and put to a beneficial use. The following goals have been proposed for water appropriation: (1) establish the validity of one's own water rights claims against those of all competing water users; (2) obtain a permanent quantification of federal reserved and Indian water rights in order to (a) provide certainty with respect to the division of the water supply, (b) to permanently settle upon specific water right entitlement for each Indian tribe in order to avoid continued expansion of that entitlement due to technological improvements or changing legal doctrines, (c) remove potential damages claims by or on behalf of the tribe for interference with their water rights, and (d) force consideration of federal/state water policy changes to allow parties to live with the outcome; and (3) create opportunities to build cooperative relationships between Indian and non-Indian communities, including negotiated resolution of water rights conflicts where all parties can be considered winners. SALT RIVER PIMA-MARICOPA INDIAN COMMUNITY WATER RIGHTS SETTLEMENT ACT OF 1988.
Department of the Interior, Phoenix, AZ. Office of the Field Solicitor.
W. H. Swan.
IN: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 87-93.

Descriptors: *Arizona, *Indian water rights, *Legal aspects, *Legislation, *Salt River, *Water resources management, *Water rights, *Water use, Competing use, Groundwater, Indian reservations, Phoenix, Riparian rights, Salt River Pima-Maricopa Indian Community,Salt River Project.

Following years of negotiations, Congress approved the Salt River Indian Water Rights Settlement Act in October 1988. This settlement is the first Indian water rights settlement which involves the major urban area of the State of Arizona, the Phoenix metropolitan area, and also the major water developer-user in the state, the Salt River Project. Basically, the settlement provides that the Community will have the use of 122,400 acre ft/yr developed from the following components: (1) Kent Decree water, with storage provided via Central Arizona Project (CAP) storage space; (2) Contribution of stored water from Salt River Project (SRP)--9,074 acre ft; (3) Bartlett Dam agreement water--20,000 acre ft; (4) CAP entitlement--13,300 acre ft; (5) Contribution from the Roosevelt Water Conservation District--8,000 acre ; (6) Contribution from the Roosevelt Irrigation District--10,000 acre ft; (7) Contribution from alley cities in the amount of 20,000 acre ft from ity lands within the SRP area; and (8) Developed roundwater on the reservation--23,250 acre ft. he Salt River settlement provides an important recedent with regard to other potential Indian ater rights settlements in Arizona and in other ates. Many of the remaining Indian water rights isputes in Arizona present situations of similar omplexity, and therefore it is important that the on-Indian participants now recognize that settleents such as these can be accomplished with fficient dedication of time, attention and creativi-. late 1988, Public Law 100-512 was enacted thorizing the implementation of a water rights ttlement agreement among the Salt River Pimaaricopa Indian Community (SRPMIC), local n-Indian public agencies in Arizona, and the ederal Government. The most difficult issues that ere addressed during the negotiation of the settlent agreement and the implementing legislation ere the appropriate level and division of Federal d local cost sharing for the settlement, and how measure those contributions. During the latter ges of the negotiations, these issues became criti-, and shaped much of the character of the tlement. This paper presents three different anal-es used to evaluate the relative contributions of settlement participants. One analysis represents initial position adopted by the non-federal paripants in their analysis of the relative contribuns to the settlement. A second analysis repreits the Federal re-analysis of those proposed ntributions, the identification and measurement other financial effects, and a summation of the al settlement cost sharing. Last, an additional deral analysis of the settlement is presented based on the relative legal exposure of the non-Indian settlement participants compared to that of the Federal government. It should be recognized that the Federal government is far from a homogeneous entity in this situation. Ultimately, the negotiated cost sharing between Federal and non-Federal parties came down to both a subjective and objective calculation of risk, liability and equity parameters involved. IMPROVING THE PROSPECTS OF NEGOTIATED SETTLEMENT OF AMERICAN INDIAN WATER RIGHTS DISPUTES.
Colorado Univ. at Denver. Graduate School of Public Affairs.
L. Burton.
IN: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 115-125, 15 ref.

Descriptors: *Indian reservations, *Indian water rights, *Legislation, *Water demand, *Water rights, Federal jurisdiction, Governmental interrelations, Management planning, Planning, Water resources management.

Current efforts to compel American Indian tribes to negotiate the settlement of their water rights claims are fundamentally flawed, because of both a serious and irreconcilable conflict of interest within the Interior Department (which is purporting to sponsor these negotiations), and Congress' historic failure to fully honor such agreements once made. The negotiation process could be made more fair by establishment of an American Indian Water Rights Commission, in which the department would participate but which it would not control. The functions of such a commission would include intergovernmental water resource planning, data base generation, model agreement drafting, the adoption of guidelines and principles for the negotiation process, and the empaneling of mediators and sponsorship of negotiations. In appropriated river basins, tribal claims may be honored in part by the voluntary market-based reallocation of existing supplies and the augmentation of existing supplies through state-of-the-art conservation techniques applied to existing irrigation facilities. Commission activities, reallocation, and conservation retrofitting can be financed by the interest from a trust fund created by a 10 year surcharge on the sale of water and power from Bureau of Reclamation-managed facilities. INDIAN WATER RIGHTS: NEGOTIATION; AGREEMENT; LEGISLATIVE SETTLEMENT.
Utah Univ., Salt Lake City. Dept. of Political Science.
D. McCool.
IN: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 127-134, 18 ref.

Descriptors: *Indian reservations, *Indian water rights, *Legislation, *Water resources management, *Water rights, Colorado Ute Indian Water Rights Settlement, Competing use, Regulations, Salt River Pima-Maricopa Indian Community, San Luis Rey Indian Water Rights Settlement, Water demand.

Three Indian water rights settlements were passed by Congress in 1988: the Colorado Ute Indian Water Rights Settlement Act, the San Luis Rey Indian Water Rights Settlement Act, and the Salt River Pima-Maricopa Indian Community Water Rights Settlement Act. Although each settlement act is unique, there are certain similarities and trends that can be discerned in the legislation. Themes are addressed which are common to these efforts to resolve Indian claims to water through a process which typically includes three stages: prolonged negotiation; an agreement signed by the principle parties; and the affirmation of that agreement via a legislative settlement act. CONSTRAINTS IN THE SALT RIVER PIMA-MARICOPA WATER RIGHTS SETTLEMENT ACT.
Arizona Univ., Tucson. Dept. of Agricultural Economics.
K. A. Rait.
IN: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 135-143, 1 fig, 12 ref.

Descriptors: *Indian reservations, *Indian water rights, *Water resources management, *Water rights, Legal aspects, Legislation, Marketing, Salt River Pima-Maricopa Water Rights Settlement, Water demand, Water use.

The Salt River Indian Community's water rights were quantified through the Salt River Pima-Maricopa Water Rights Settlement Act. Two aspects of the Act which constrain the community's water use flexibility are discussed in this paper. The first deals with the per acre water allocation which is considerably less than the amount allotted to the neighboring farmers in the Phoenix Active Management Area. This raises the question as to whether the Reservation will be able to fulfil the purposes for its creation. Second, the Act expressly limits the community's opportunities for marketing its waters. Relaxation of these marketing-related legal constraints would make the Act more consistent with the evolving water marketing policies throughout the West which are responding to maturing water economies and acknowledgements of scarcity. Regional water marketing activity indicates that leasing could be a stable source of income to the community. The policy-makers involved with the Salt River Pima-Maricopa Water Rights Settlement Act should remove the constraints imposed by the acre-foot per acre allotment and introduce a leasing option. Through extension of the same property rights given to non-Indian water users, the sovereign Community could maximize the net social sand economic benefits of their waters. FLORIDA SEMINOLE INDIAN DISPUTE SETTLEMENT INCLUDING WATER RIGHTS COMPACT AND MANUAL.
Blain and Cone, Tampa, FL.
L. M. Blain.
IN: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 145-151.

Descriptors: *Florida, *Indian reservations, *Indian water rights, *Legislation, *Seminole Indians, *Water resources management, *Water rights, Competing use, Governmental interrelations, Manuals, Permits, Regulations, State jurisdiction, Water demand, Water supply.

The Seminole Tribe of Florida filed suit in 1978 against the State of Florida and South Florida Water Management District, claiming that the state had granted flowage easements over Indian lands without sufficient congressional approval or compensation. Value of the claims for ejectment, damages, inverse condemnation, and breach of trust, was uncertain but had an estimated potential of ten million dollars. Florida has a highly developed regional water management system. The districts operate drainage and water supply facilities, regulate consumptive use of water and surface water management through a permit system, and other environmental protection. The South Florida Water Management District operates and maintains two large canals which transverse tribal and adjacent lands, supplying irrigation water and providing drainage facilities. One of the many components suggested in attempting to negotiate settlement of the Seminole's claims was the formation of a water rights compact among the tribe, the State, and the water management district to establish the tribe's water rights within the framework of Flor-

ida's water management system. Approving State legislation was necessary but before it could be enacted the water rights compact and its accompanying criteria manual had to be completed and agreements between the tribe and adjacent landowners had to be entered into. GROUNDWATER OWNERSHIP AND CONTROL IN INDIAN COUNTRY.
Du Bey Law Firm, Seattle, WA.
G. D. Parker.
IN: Indian Water Rights and Water Resources Management. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1989. p 153-164, 63 ref.

Descriptors: *Groundwater resources, *Indian reservations, *Indian water rights, *Water rights, *Water supply, Federal jurisdiction, Groundwater quality, Legal aspects, Public policy, Regulations.

Current Federal Indian policy recognizes and supports Indian tribal claims to groundwater resources. Tribal claims to reservation groundwater may be asserted under the reserved water right doctrine, and as tribal proprietary rights. Indian tribes can strengthen tribal claims to groundwater by establishing tribal ownership of groundwater in the same way that tribes assert ownership of other natural resources within the exterior boundaries of Indian reservations--through tribal proclamations, laws and contracts. Tribal governmental action to protect the quantity and quality of groundwater is supported by current federal law and policy. A tribe's ownership interest would be further enhanced through enactment of tribal resolutions proclaiming the tribe's sovereign and proprietary ownership of groundwater, and a demonstration that such waters are necessary to fulfill the purposes of the reservation. A tribe's groundwater rights should not be limited by a narrow application of the Winters doctrine. A tribes ownership interest in groundwater goes beyond an amount determined to be necessary to meet the purposes for which the reservation was created. The ability of a tribe to survive and become economically independent, depends on the resources of the reservation. In many instances, the quality and quantity of the groundwater resource is a key to the health of the reservation population and the quality of the reservation environment. Tribal governments must take action to protect their interests before groundwater reserves are polluted, diminished or exhausted. (See also W91-02262) (Lantz-PTT)

ADVANCES TOWARDS WATER RESOURCES DEVELOPMENT THROUGH HYDROLOGICAL TRAINING AND EDUCATION.
Vizgazdalkodasi Tudomanyos Kutato Intezet, Budapest (Hungary).
G. Kienitz.
IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 68-89, 2 fig, 3 tab, 4 ref.

Descriptors: *Africa, *Developing countries, *Education, *Hydrology, *Training, *Water resources development, Financing, Management planning.

In Africa, the unfavorable spatial and temporal distribution of rainfall necessitates human intervention in the hydrological regime to provide protection against flooding and for counteracting droughts. The basis of water resources development is a thorough knowledge of the hydrological regime and of the involved laws of nature. An adequate number of experts in water resources development combined with a proper knowledge of hydrology is a preliminary to general economic development in a country. The systematic measurement of hydrological elements should be regarded by any administration as an indispensable basic task carried out for the sake of future developments. Most African countries lacked an adequate number of hydrologists at the time of gaining their independence and hydrological knowledge was scarce. Both local efforts and external assistance have sought to overcome these problems. The two most favored methods of rectifying the situation have been the sending of high-level hydrologists to African countries for specific tasks and the granting the fellowships to Africans for high-level training in developed countries, on the other hand. Both these approaches offer benefits for the persons involved. Less effort was directed toward local training for hydrological personnel. The appropriate planning of hydrological training and education should be conceived as (1) defining a country's required number of hydrologists of different levels for the foreseeable period based on long-term development objectives, (2) planning the training facilities required in the country and taking steps for their realization, including external assistance, (3) seeking highest level hydrological education, including post-graduate training, in developed countries for a limited number of selected personnel. Setting up a staff of local hydrologists using aid from developed countries is important. (See also W91-02288) (Author's abstract)

POST GRADUATE COURSE IN HYDROLOGY AND HYDROGEOLOGY (FORMATION POST-UNIVERSITAIRE EN HYDROLOGIE ET HYDROGEOLOGIE).
Ecole Inter-Etats d'Ingenieurs de l'Equipement Rural, Ouagadougou (Burkina Faso).
A. Kapfer.
IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 911-918, 2 append. English summary.

Descriptors: *Africa, *Civil engineering, *Developing countries, *Education, *Geohydrology, *Hydrology, Burkina Faso, Engineering personnel, Groundwater, Rural areas, Surface water, Water resources development.

Since 1984 the EIER (Ecole Inter-Etats d'Ingenieurs de l'Equipement Rural) has offered a 1-yr postgraduate course in water resources engineering at Ouagadougou, Burkina Faso. The course is intended for engineers with at least 2 yr professional experience in the water sector. Both surface water and groundwater engineering are included covering the following subjects: qualitative and quantitative assessment of surface and groundwater resources; planning, design, and follow-up of hydraulic structures (e.g., dams, river intakes, pumping stations, wells, and drillings); fitting of structures to their intended purpose; and technical and sanitary maintenance of structures. Theoretical lectures, tutorials, and experiments are combined with hands on construction of works in connection with contractors. Site visits and study tours are included in the course. Participating students come from different countries and have a wide range of background and professional experience. The course is divided in two equal parts dealing with surface water and groundwater. It is adapted to the students' diverse backgrounds. In 1988, CAMES granted the course an equivalence with a DESS (Diplome d'Etude Superieur Specialise). Staff is partly in-house within EIER and partly visiting staff from various African and European institutions. This course, which is supported by UNESCO (ANSTI) is intended to train about 10 specialists per year in Africa who are directly involved in practical aspects of water resources engineering. HYDROLOGICAL EDUCATION AT THE AGRHYMET CENTRE (LA FORMATION EN HYDROLOGIE AU CENTRE AGRHYMET).
Agrhymet Centre, Niamey (Niger).
H. A. Maiga.
IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 919-932. 1 fig, 2 tab, 9 ref. English summary.

Descriptors: *Civil engineering, *Developing countries, *Education, *Niger, AGRHYMET, Agricultural hydrology, Geology, Hydrology, Instrumentation, Meteorology, Sahel, Training.

The Regional Training Center for Agrometeorology and Operational Hydrology in Niamey (Republic of Niger) is one of the rare institutions in Africa that has specialized in hydrological education. The Center forms part of the AGRHYMET project covering the nine CILSS (Comite Permanent Inter-Etats de Lutte contre Secheresse au Sahel) countries. The project was conceived to teach hydrology and hydrometeorology for use in agriculture and it has developed in three phases. Training in agrometeorology and hydrology always has been an important part of the project. Between 1975 and 1987, 198 students received diplomas: 91 in agrometeorology, 71 in hydrology, and 36 in hydrometeorological instrumentation. Besides basic courses, specialized courses in agrometeorology and informatics have been offered, particularly during the second project phase. Hydrological education is split into two branches, one for higher technicians, the other for civil engineers. The study programs include basic instruction and special hydrological subjects. The curriculum foresees theoretical lessons, written exercises, practical training, and field work. (See also W91-02288) (Author's abstract)

STATE WETLAND PROTECTION LEGISLATION AFFECTING FORESTRY IN THE NORTHEASTERN UNITED STATES.
Southern Forest Experiment Station, New Orleans, LA.
W. C. Siegel, and T. K. Haines.
Forest Ecology and Management FECMDW, Vol. 33/3, No. 1/4, p 239-252, June 1990. 21 ref.

Descriptors: *Environmental protection, *Forest ecosystems, *Forestry, *Land use, *Legislation, *Resources management, *Wetland forests, *Wetlands, Agriculture, Policy making, Regulations.

A number of significant developments in wetland protection and water resource legislation have occurred in the United States in recent years that affect forestry operations, both at the federal and state levels. An historical review indicates that while control of water pollution and the protection of wetlands was first addressed in 1972 by the Federal Water Pollution Control Act Ammendments (FWPCA), to date, most forestry regulation in the eleven northeastern states is carried out in response to specific situations and areas, rather than through state-wide programs. Until recently, most regulation was not very restrictive except in certain limited circumstances. Furthermore, many of the laws are conflicting, inconsistent, and overlapping, causing confusion among woodland owners and loggers. In some cases the requirements are so rigid and complex that forestry operations are also needlessly expensive. All indications point to the conclusions that nonpoint source water pollution prevention and wetland protection will continue as both important national and state priorities. As the northeastern states begin to address renewed efforts under Section 319 of the 1987 Amendments to the FWPCA, the forestry community in the northeast should be aware that the current regulatory trend could be only the tip of the iceberg. It will be important, therefore, that forest landowners, woodland managers, and timber operators in the northeast work closely with lawmakers in the development and modification of water resource and wetland protection legislation. Legislators and policy makers need to be informed of the potential effects of overly aggressive and poorly formulated statutes on forest management. They should also be made aware of the interacting and conflicting provisions of current federal, state and local water and wetlands laws affecting forestry. Coordination in these efforts will be essential if forest owners and managers do not continue to be

onfronted with a labyrinth of inconsistent, confus-ng, and overly restrictive regulations. Forest ector input will be crucial to retaining a reasona-le operating environment while, at the same time, nsuring that water quality and wetlands are ade-uately protected. (D'Agostino-PTT)

ederal legislation regarding wetland protection egan with the enactment of the 1972 Amendments the Federal Water Pollution Control Act. Sec-on 404 of the Act states that any activities that eposit dredged or fill material in the nation's aters or wetlands would be subject to regulation y the U.S. Army Corps of Engineers which cur-ntly determines permit requirements subject to PA review. All dredge-and-fill activities require ermits, excepting rare specific cases, and other perations, such as road building and timber pro-uction, must follow best management practice uidelines for exemption. At the regional level, lequate classification methods are necessary to elineate those areas which warrant protection. In e southeastern states such as Georgia, such delin-ation schemes are usually based on the evaluation three ecological parameters unique soils, vegeta-on adapted to wet conditions, and the presence of ater. To date, most forest operations in progress ave not been seriously affected by the dredge-d-fill permit requirements. Much forest land, ven in the southern coastal plain, would not be assed as wetlands under the Corps delineation ethods. Some bottomland hardwoods, cypress vamps, and pocosins would fall within the wet-nds definition. This constitutes about 10-20% of e total forest area in the South, but much of the nds are not viable for commercial timber produc-on. Most commercial southern pine-forest types ould not be classed as wetlands, and thus not bject to Section 404 regulation. In most southern ates, federal wetlands regulations have affected ily a fraction of the commercial timber-growing perations. Several areas do, however, have poten-l for much greater effects. These include much the Mississippi Delta, southern Louisiana, Flori-, the Carolina pocosins, and other large swamps. the pervasive national sentiment for preserving etlands and vigorous enforcement by the Corps d EPA prevail, many of these lands will have to managed in their natural state, or not at all. Located in west-central Nevada in the vicinity of the town of Fallon, the Newlands Project utilizes water from the Carson and Truckee Rivers to irrigate Nevada's most productive agricultural region. As a result of recent court decisions, the Bureau of Reclamation is responsible for developing operating criteria and procedures (OCAP) for the Newlands Project. A key provision of the OCAP is the annual establishment of the quantity of irrigation water diversions to the project. Annual diversions are based on the number of acres of land possessing legal water rights that are actually under irrigation. The specific entitlement per acre is dependent on whether land is designated as bench land or bottom land, a soil-type distinction. To facilitate the OCAP water allocation effort, a digital geographic database was developed by the Bureau's remote sensing section. Several critical information layers, including water righted lands, bench and bottom lands, and irrigation lands were entered into the database to portray conditions in the project area during the 1984 growing season. The information layers had as their sources both map and remote sensing data. Computer software was then used to derive section by section summaries of irrigated, water righted bench and bottom lands, and irrigated lands without water rights. A set of custom 7-1/2 min quadrangle maps and map overlays was produced with a computer-driven drum pen plotter to portray the information layers. Techniques for the rapid update of the irrigated lands information layer using satellite imagery and airborne video technology were also developed for application in subsequent years. ENVIRONMENTAL AND AGRICULTURAL IMPLICATIONS OF DAM CONSTRUCTION IN THE NIGER VALLEY OF MALI.
Gesamthochschule Paderborn (Germany, F.R.).
H. K. Barth.
IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 857-869, 5 fig, 6 ref.

Descriptors: *Dam effects, *Deltas, *Environmental impact, *Mali, Farming, Fish, Floods, Flow augmentation, Gania floodplain, Interior Delta, Niger River, Rice, Sedimentation, Soil genesis, Vegetation.

The Niger/Bani drainage system is highly complex with regard to catchment area, discharge, and runoff characteristics. The most critical part of the river's drainage basin is the Interior Delta of the Niger. Due to extremely variable discharge rates and in conformity with its geomorphology, this vast delta is flooded seasonally with a significant shift in flooding phases between Ke-Macina and Tombouctou. Due to the high sensitivity of the complex hydrologic system of the delta region, building dams in the upstream parts of the river interferes seriously with the natural hydrologic conditions of the Interior Delta. In the Gania floodplain (upper delta) the annual flooding occurs through a functioning network of old river channels or, in most cases, by overflowing the system of embankments. Soil development is influenced by the sedimentation processes during floods. Vegetational pattern reflects the differences in soils and flooding regime in different parts of the Delta. Although the Selingue Dam originally was designed to provide artificial floods, this could not be maintained, leading to failure to inundate vast areas of the floodplains over the last 5 yr. Growth of natural 'bourgou' grass was reduced substantially, with attendant reductions in feeding and breeding of fish. Rice production also fell. More than a million people were impacted by these effects. (See also W91-02288) (Rochester-PTT)

IMPACT OF HYDROLOGY ON HYDRAULIC PROJECTS IN BURKINA (IMPACT DE L'HYDROLOGIE SUR LES PROJETS HYDRAULIQUES AU BURKINA).
Ministry of Water Resources, Ouagadougou (Burkina Faso). Service de l'Hydrologie.
S. Traore.
IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 870-888, 6 ref. English summary.

Descriptors: *Burkina Faso, *Dam effects, *Dams, *Drought, *Water resources management, Artificial lakes, Data acquisition, Diversion, Economic aspects, Hydrologic data, Irrigation water, Monitoring, Regulations, Water quality control.

The threat of drought has forced Burkina Faso to undertake intensive water resources development. Digging of dams has assumed great importance thanks to hydraulic organizations in place since the droughts of 1972-1974 and 1983-1984. This activity enabled irrigated cultivation on a large scale. There are 712 dams and 3 international great basins in the territory. These different hydraulic works have undoubtedly affected the natural hydrologic network of the country, through the profound changes brought about in the basin by the creation of artificial lakes and the diversion of rivers (totally or partially) to create water sources. This increasing number of projects necessitates a respect for scientific rules in their realization and necessitates strict respect for the water law in Burkina Faso, which was enacted on 1 April 1983 to regulate human intervention in water resources. The success of the projects and the effective administration of water resources is strictly related to the quality and reliability of hydrologic data. This makes it essential to maintain and reinforce the hydrometric network. The administration of a hydrometric station is very difficult co pared to the financial resources available to the National Hydrologic Service. It is time that all users contribute materially to the acquisition of basic data for a better national hydrometric network administration in the common interest in order to safeguard water resources in the Sahel countries. WETLANDS AND GROUNDWATER: NEW CONSTRAINTS IN GROUNDWATER MANAGEMENT.
Universidad Complutense de Madrid (Spain). Dept. of Geodynamics.
M. R. Llamas.
IN: Groundwater Management: Quantity and Quality. Proceedings of the Symposium held at Benidorm, Spain, October 2-9, 1989. International Association of Hydrological Sciences, Washington, DC. 1989. p 595-604, 2 fig, 13 ref.

Descriptors: *Aquifer management, *Case studies, *Drainage effects, *Groundwater management, *Groundwater resources, *Irrigation effects, *Spain, *Water resources management, *Water supply development, *Wetlands, Agricultural watersheds, Coastal areas, Ecological effects, Geohydrology, Groundwater potential, Irrigation, Legal aspects, Political aspects, Water demand, Wetland restoration.

A great percentage of the wetlands in many countries has been destroyed over the last century through different causes, mainly because of drainage for agricultural reclamation. The role of groundwater in the behavior of wetlands has usually been recognized in a general way but detailed studies on the hydrogeology of wetlands are still scarce. Documented cases about the adverse impacts of groundwater exploitation on wetlands are almost nonexistent. The problems in two wetlands in Spain were analyzed. Both sites have intense legal protection; however, the sizes, hydrogeological, and ecological characteristics and the legal and social aspects of both sites are somewhat different as are their respective degrees of deterioration. Nonetheless, the main cause of such deterioration is the depletion of the water table caused by groundwater withdrawal for water supply and/or irrigation purposes. In the regions where there is a strong demand for water it is going to be difficult to conserve the ecosystems situated in discharge areas of aquifers containing fresh water owing to the economic value of groundwater. If these ecosystems are to be conserved, much more decisive prior action is required both in terms of the hydrogeological education of the government officials involved, politicians and the public in general, and also in terms of seeking financial compensation for those who are adversely affected by this conservation. A dam currently being built in the Danube River in northwestern Hungary is being studied to determine its effects on the flow and quality of groundwater in its environment. The present pre-project state was examined first; for its simulation a model was developed which consists of a flow, a transport, and a chemical model. Regional dispersivity values, necessary for the transport simulation, were determined by detecting dispersive transport of the natural tritium isotopes in the groundwater. Transport processes were simulated by the random walk method while chemical reactions were simulated using a previously-developed chemical model. The model-system calibrated for the pre-project state is to be used to predict groundwater quality for the post-project state. Simulation of the Szigetkoz groundwater quality is now at an intermediate stage. In spite of this, some previous results indicate that in the post-project condition, a reduction of discharge in the Danube main channel will occur. It causes a considerable change in the main direction of groundwater flow, while the quantity of water increases due to infiltration from the enlarged area of impounded water surface in the reservoir. A series of recharge facilities to compensate for the descending water table were tested by electrical analog. The results showed that a combined canal system would cause the elevation of the water table to an acceptable level for agriculture and other activities. The water quality of the reservoir is expected to be different from that of the present Danube water. These effects together will probably result in an essential change of the groundwater quality. Descriptors: *Groundwater management, *Groundwater mining, *Model studies, *Pleistocene aquifers, *The Netherlands, *Water conservation, *Water resources management, Flora, Plant populations, Policy making, Soil aeration, Soil analysis, Soil water, Species composition, Water depth.

A model to predict the effects of groundwater withdrawal on the local flora was developed to provide a method to evaluate policy constraints regarding water use and water management in the Netherlands. It consists of five submodels, each dealing with a single or complex factors, namely: (1) soil moisture supply, (2) soil aeration, (3) soil nitrogen availability, (4) environmental dynamics, and (5) depth of open water. Plant species response to changes on the value of these factors was shown in the measurement of their moisture and nitrogen content and also in their environmental stability classification. The use of this model requires data on the soil and hydrology of the area, species composition of the vegetation, and changes in groundwater depth and moisture availability resulting from groundwater withdrawal. The end result is a list indicating the probability that the species in the area studied will disappear. This list would therefore serve as a basis to evaluate the impact of groundwater withdrawal when dealing with the conservation value of a study area. Sensitivity analysis of the model gave satisfactory results although comparison of field data and simulation studies was unsatisfactory. This was attributed mainly to incomplete and inaccurate field data. (Medina-PTT)

Descriptors: *Data acquisition, *Data collections, *Developing countries, *Reservoir design, *Statistical analysis, *Streamflow data, *Streamflow forecasting, *Water resources data, *Water resources development, *Water supply, Cost analysis, Economic aspects, Monte Carlo method, Reservoirs, Stream discharge, Stream gages.

In most developing countries the need to design reservoirs when little or no streamflow data exist for the purpose is commonplace, with the result that such designs are frequently in error and fail to deliver projected yields. A Monte Carlo simulation experiment has been performed to quantify the distortion due to short data record length associated with capacity estimates obtained from limited streamflow data records. The analysis was made more relevant to developing economies by limiting it to direct supply impounding reservoirs prevalent in such regions. Streamflow data from three European rivers were used to simulate a large number of equally likely synthetic time series of streamflow data, which were analyzed for the hydrological parameter of interest. The synthetic trace was extended to 1000 years to generate an estimate of the 'true' reservoir capacity, then broken down into sequences of shorter length (4 to 50 years). The resulting series of the hydrological parameter is then analyzed to determine its distribution, risk of failure, and other statistical characteristics. The simulation routing was done on a monthly time scale to accommodate both within-year and over-the-year storage requirements. The results show that streamflow data record length does have significant influence on reservoir capacity estimates; with a 6-year data record the error in capacity estimates averages about 30%, and with a 20-year record the error in capacity estimates averages about 15%. The financial implications of these large errors should help convince politicians in the developing world to invest more in basic hydrological data collection. (Tappert-PTT)

urface water resources in Africa exhibit great terannual fluctuations due to the climatic variions occurring in this area. The assessment of the source encounters numerous problems in relation the difficult conditions of operating the networks, accessibility of measurement stations, and nancial means. The historical growth of these tworks is discussed. ORSTOM's commitment in e sahelian countries, sustained by the Inter-African Committee for Hydrologic studies, has made it ssible to establish a basic understanding of hydrometeorological phenomena and useful synthes. The drought of the last 20 yr is the most severe the century. The water yields to the sahelian ne have fallen 40%. The major rivers, such as e Senegal and the Niger, have been affected amatically, with very weak floods and severe w flows, whereas the runoff distribution on small helian watersheds seems to be unchanged, sugsting that the dry period favors increased surface noff. ue to the advent of new information and technoly, the present methods utilized for conducting rest resource inventories are currently being aluated by the USDA Forest Service. There is a essing need for more specific and effective data llection techniques, as well as more cost-effece methods, including coordinated inventories d data sharing. Some changes regarding informan requirements, integrated inventories, planning d monitoring capabilities are already taking ce as a result of remote sensing devices, comter technology and improved field techniques. is technology can ultimately provide improved ource inventories for the classification and deeation of all types of ecosystems, including ored wetlands. It is suggested that the policy ecting these resources must be managed on an ernational level in order to ensure the survival forested wetlands. Four courses which should considered are: (1) Take a holistic approach to ource inventories; (2) Develop an international definition and classification system for wetlands; and (3) Have an international group champion the monitoring of forested wetlands on a global basis. TEMPORAL VARIABILITY OF WATER QUALITY AND THE IMPLICATIONS FOR MONITORING PROGRAMMES IN IRISH LIMESTONE AQUIFERS.
Trinity Coll., Dublin (Ireland). Environmental Sciences Unit.
C. Coxon, and R. H. Thorn.
IN: Groundwater Management: Quantity and Quality. Proceedings of the Symposium held at Benidorm, Spain, October 2-9, 1989. International Association of Hydrological Sciences, Washington, DC. 1989. p 111-120, 4 fig, 2 tab, 8 ref.

Descriptors: *Groundwater management, *Groundwater pollution, *Groundwater quality, *Network design, *Sampling, *Water quality management, *Water resources management, Aquifers, Geohydrology, Groundwater movement, Ireland, Karst hydrology, Limestone, Monitoring, Path of pollutants, Pollution load, Temporal distribution, Water pollution sources, Water sampling.

The first step in designing a groundwater sampling program must be to determine the degree of temporal variation, as the greater this is the more samples are required to obtain the same degree of precision. Contaminated sites show greater temporal variations; the degree of variation determined at clean sites may not be applicable to contaminated sites within the same hydrogeological setting. The hydrogeological situation must be determined, because temporal variability increases with the transition from intergranular flow to fissure flow. In the case of karst aquifers, the range of behavior is such that generalizations from one site to another should not be made. An investigation has been made of temporal changes in water quality in some Irish limestone aquifers. Twenty-two groundwater sources in aquifers ranging from intergranular flow in limestone sand and gravel aquifers to conduit/fissure flow in karst aquifers were sampled every two weeks for one year. The results show that the groundwater sources with the greatest water quality variability are either those that are contaminated or those situated in the mature karst aquifers. The results have clear implications for monitoring since they show that the usual guidelines for sampling groundwater are not necessarily appropriate in limestone aquifers. EFFECTS OF FLOW DISTURBANCES ON THE ACCURACY OF TURBINE-TYPE WATER METERS.
P. Harrison.
Aqua AQUAAA, Vol. 39, No. 4, p 250-257, August 1990. 8 fig, 3 tab, appendix.

Descriptors: *Flow measurement, *Pipe flow, *Water metering, Design standards, Hydraulics, Performance evaluation, Testing procedures.

The accuracy of a water meter when installed in a pipe is affected by disturbances in the flow of water passing through it. Installing the meter in a sufficient length of straight pipe will eliminate the effects of the disturbance, but the necessary lengths for particular disturbance patterns, and for the different meter types and sizes, are not known. A research program, initiated by the Eureau EU10 committee and given financial assistance by the Community Bureau of Reference of the European Community, was implemented to determine if existing meter installation stipulations were valid for modern turbine-type water meters. Meters tested were single jet meters, multi-jet meters, and Woltmann-type meters. The tests were carried out by eleven laboratories in five countries, and utilized eleven different water meters in seven sizes. In-line flow disturbance devices were developed and used by all the laboratories to create identical 'standardized' flow disturbances. The two types of disturbances studied were velocity profile distortion and swirl. The establishment of valid comparisons between each laboratory was based on the use of 'round-robin' tests on individual meters, and the tests carried out to investigate the effects of flow disturbances. Virtually all of the meters tested failed to comply with the installation provisions. The Committee considered that the straight lengths of pipe called for in the Document were already as long as was commercially practical, and that it was necessary to require manufacturers to supply new designs for water meters. ANALYSIS OF THE IN SITU CONSTANT-HEAD PERMEABILITY TEST IN CLAYS.
McGill Univ., Montreal (Quebec).
F. Tavenas, M. Diene, and S. Leroueil.
Canadian Geotechnical Journal CGJOAH, Vol. 27, No. 3, p 305-314, June 1990. 15 fig, 14 ref.

Descriptors: *Clays, *Data acquisition, *Permeability, *Permeability coefficient, *Piezometric head, *Soil tests, *Soil water, Clogging, Finite element method, Mathematical analysis, Quebec, Soils.

The in situ measurement of soil permeability has become an important part of geotechnical engineering. Tests in boreholes and piezometers are often adversely affected by the possible remolding of the soil and clogging of the probe during installation. New self-boring equipment has made the execution of in situ constant-head tests in fine-grained soils simple and reliable. However, the theories used for the interpretation of constant-head tests in low-permeability soils still present some shortcomings, most notably a failure to properly account for the clay behavior or the effect of probe geometry. A finite element analysis of the constant-head test in clays was developed to evaluate the various expressions of shape factor published in the literature, and to provide a basis for extrapolating transient state observations to steady state conditions from which the permeability may be computed. A method was developed that determined an acceptable linear relationship for flow-time data and proposed a shape factor to account for vertical flow near the end sections of the probe in isotropic media. The resulting method of interpreting in situ permeability tests was applied to a series of field results obtained from a Champlain clay deposit. The field results confirm the finite element analysis and validate the method for interpreting constant-head tests. (Tappert-PTT)

METHODS FOR MEASURING THE SATURATED HYDRAULIC CONDUCTIVITY OF TILLS.
Norges Landbrukshoegskole, Aas.
P. D. Jenssen.
Nordic Hydrology NOHYBB, Vol. 21, No. 2, p 95-106, 1990. 3 fig, 1 tab, 36 ref.

Descriptors: *Data acquisition, *Glacial sediments, *Groundwater movement, *Hydraulic conductivity, *Saturated flow, *Till, Geologic fractures, Sediment sorting, Sedimentation.

The texture of tills excludes many of the traditional methods for measurement of the saturated hydraulic conductivity (K). The hydraulic conductivity is scale dependent, and for massive, relatively homogeneous till a representative sample volume of 10,000 to 100,000 cubic centimeters is suggested; for very heterogeneous sediments and sediments with large fracture spacing larger samples may be needed. There are no ideal methods for measuring K in till and type of method and equipment should be carefully selected. The main sources of uncertainty in laboratory methods include representativity of the sample (due to size, structure, and density) and interfacial flow along the tube/sediment interface. Field methods are considered to give better estimates of K than laboratory or correlative methods because the test sediment is less disturbed and a larger volume is utilized. Studies comparing and evaluating different test methods for use in till are few, and comparative studies should be carried out. In the unsaturated zone a variant of the inverse auger hole method using a constant head and a lined pit is recommended over cylinder infiltrometers. In the saturated zone measurements in dug wells are considered the most representative method. A greater number of methods are suitable for use in clayey/silty till than in sandy/gravelly till, due to the higher stone content in the latter. Correlative methods can only be used for very approximate predictions of the saturated hydraulic conductivity in till. (Tappert-PTT)

EXAMS 2: EXPOSURE ANALYSIS MODELING SYSTEM.
Bayreuth Univ. (Germany, F.R.). Chair of Ecological Chemistry and Geochemistry.
K.-W. Shramm.
Toxicological and Environmental Chemistry TXECBP, Vol. 26, No. 1/4, p 73-82, 1990. 2 fig, 1 tab, 4 ref.

Descriptors: *Computer models, *Computer programs, *EXAMS 2 model, *Model studies, *Path of pollutants, *Population exposure, *Toxicology, Aquatic environment, Limnology, Organic compounds, Pollution load, Water quality.

EXAMS 2 was developed for rapid evaluation of the behavior of organic chemicals in aquatic ecosystems. EXAMS 2 inputs include the chemistry and relevant transport and physicochemical properties of the compound and the ecosystem. Model outputs are (1) expected environmental concentrations, (2) the fate of chemicals due to transport and transformation processes, and (3) the persistence of chemicals in the system once chemical loadings terminate. The program is interactive and allows the user to define and store the properties of chemicals and the environment. Loadings, transport, and transformations are combined into a set of differential equations assuming conservation of mass. Chemical mass entering from and leaving to the environment is treated as the algebraic sum of external loadings, transport processes that export chemicals from the system, and transformation processes that convert chemicals to their transformation products. Water bodies can be made up of a set of distinct environmental zones, such as benthic, epilimnic, hypolimnic, and littoral compartments. EXAMS 2 accepts standard water quality and limnological parameters. The program will support up to 999 environmental compartments. Although EXAMS 2 is combined with terrestrial models the present version is not able to model chemical concentrations in the air above the water surface. Thus, simple contamination of the water by the atmosphere cannot be modeled. (Author's abstract)

EVALUATION OF THE CONTINUOUS SEISMIC-REFLECTION METHOD FOR DETERMINING THE THICKNESS AND LITHOLOGY OF STRATIFIED DRIFT IN THE GLACIATED NORTHEAST.
Geological Survey, Hartford, CT. Water Resources Div.
F. P. Haeni.
IN: The Northeast Glacial Aquifers. Regional Aquifer Systems of the United States. Papers presented at AWRA Symposium on Monitoring, Modeling, and Mediating Water Quality, May 17-20, 1987, Syracuse, New York. AWRA Monograph Series No. 11, 1988. p 63-82, 13 fig, 1 tab, 24 ref.

Descriptors: *Continuous seismic reflection, *Data acquisition, *Geohydrology, *Geophysical surveys, *Glacial aquifers, *Groundwater resources, *Lithology, *Regional Aquifer-Systems Analysis, *Stratified drift, Aquifers, Connecticut, Connecticut River, Geophysics, Maine, New Hampshire, River sediments, Saco River, Seismic reflection.

Continuous seismic-reflection methods have been used for several years in shallow water to determine depth to bedrock or thickness of alluvial and glacial deposits. Acquisition of data in narrow, shallow waterways has been difficult, but recent development of improved sound sources and data collection methods has enabled collection of high quality field data, even in rivers only a few feet deep and a few hundred feet wide. Evaluation of data collected at localities where extensive drill hole control was available and under variable field conditions has shown that the results of this technique are highly dependent on site conditions. Where the riverbed sediments and the glacial drift are primarily fine grained, detailed depositional features of the drift can be detected. Where the riverbed sediments and the glacial drift are primarily coarse grained, however, only major stratigraphic boundaries, such as the stratified drift/till or drift/bedrock contacts, can be detected. In several localities on the Connecticut River in Connecticut, and on the Saco River in maine and New Hampshire, the distribution of coarse-grained and fine-grained stratified drift, thick till, and bedrock, delineated from seismic-reflection records, agreed closely with nearby drill hole data. Along the Farmington River in Connecticut, very thick fine-grained stratified drift deposits overlying bedrock were initially delineated by continuous seismic-reflection methods and subsequently verified by test drilling. Descriptors: *Chemung River, *Chenango River, *Continuous seismic reflection, *Data acquisition, *Geohydrology, *Geophysical surveys, *Glacial aquifers, *Glacial drift, *Groundwater resources, *Regional Aquifer-Systems Analysis, *Susquehanna River, Aquifers, Geophysics, New York, Pennsylvania, Sand, Silt, Stratigraphy, Surveys.

Continuous, high-resolution seismic-reflection profiling was used to define the stratigraphy of glacial drift along reaches of the Susquehanna, Chemung, and Chenango rivers in south-central New York and north-central Pennsylvania as part of an investigation into the application of continuous seismic-reflection profiling to studies of glacial valley aquifers. Approximately 18 miles of the Susquehanna and Chemung Rivers between Waverly, NY, and North Towanda, PA, were surveyed, along with approximately 9.5 miles of the Susquehanna and Chenango Rivers near Binghamton and Endicott, NY. Surveys conducted in areas where the stratigraphic section consists chiefly of lacustrine silt and clay beneath thin deposits of gravelly alluvium and outwash achieved excellent signal penetration and defined in detail the upper surface of glacial deposits beneath the silt and clay as well as the underlying bedrock surface. From Waverly, NY, to North Towanda, PA, where this stratigraphy is typical, the surveys revealed two types of lacustrine deposits--a thick upper unit of laminated silt and clay that is virtually reflection free, and a discontinuous basal lacustrine unit of interbedded fine sand and silt that displays a draped, parallel-bedded structure over till or ice-contact deposits. Surveys conducted in areas where the stratigraphic section consists predominantly of coarse-grained outwash or ice contact deposits with little or no interbedded lacustrine material were characterized by poor signal penetration and multiple reflections from the river bottom or shallow sub-bottom. This was the general case with surveys conducted along the Susquehanna River from Endicott to Binghamton and along the lowest reach of the Chenango River. Signal penetration and resolution increased markedly in an adjacent upstream reach of the Chenango River valley, where the stratigraphic section includes thick, fine-grained presence or absence of multiple reflections appear to be a result of the relative grain size and thickness of the glacial drift. ELECTRONICS AND INFORMATICS FOR THE ACQUISITION OF HYDROMETEOROLOGICAL DATA: A GREAT TOOL FOR WATER RESOURCE MANAGEMENT IN THE SAHEL (ELECTRONIQUE ET INFORMATIQUE POUR L'ACQUISITION DES DONNEES HYDROMETEOROLOGIQUES, UN OUTIL PRODIGIEUX POUR LA GESTION DES RESSOURCES EN EAU DANS LE SAHEL).
Laboratoire General de Recherches, Brussels (Belgium).
E. Tilman.
IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 202-210, 2 fig. English summary.

Descriptors: *Africa, *Computers, *Data acquisition, *Hydrologic data, *Meteorological data collection, Automation, Climates, Cost analysis, Sahel.

Electronic and informatic techniques were developed for the acquisition of hydrometeorological data. These techniques have proven effective in a number of countries and could contribute to better and more rational water management in the Sahelian countries. Two techniques are employed: 'off-line' and 'on-line.' In the off-line system, data on temperature, relative humidity, insolation, water level, rainfall, and wind speed and direction are recorded by a portable data acquisition instrument, which can be connected by RS-232 cable for transferring data to a central processing location. In the on-line system, data are transmitted to a relay, which routes the data to a central station (PC-compatible or Macintosh microcomputer). Considerable improvements in the economical use of resources may be anticipated from the use of these techniques. (See also W91-02288) (Rochester-PTT)

REVIEW OF WATER RESOURCES INVESTIGATION AND DEVELOPMENT USING SATELLITE REMOTELY SENSED DATA OF THE NAZINGA GAME AREA, BURKINA FASO.
Council for Scientific and Industrial Research, Kumasi (Ghana). Building and Road Research Inst.
D. O. K. Kuma.
IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 211-221, 5 fig, 17 ref.

Descriptors: *Arid lands, *Burkina Faso, *Remote sensing, *Satellite technology, *Semiarid lands, *Water resources development, Aerial photography, Damsites, Nazinga Game Reserve, Sissili River, Site selection.

The Nazinga Game Reserve is situated along the Sissili River, between Po and Leo in the Republic of Burkina Faso. The ranch aims to contribute to the development of meat production within the Sahel countries and to teach the local population the advantages of animal conservation and environmental protection. Recent applications of aerial photographs and satellite remotely sensed data for identifying and locating potential dam sites and natural impoundment areas are reviewed. These reservoirs are intended to provide adequate water supply for game and wildlife within the ranch area. Aerial photographs and satellite remotely sensed Landsat (MSS) and SPOT images are useful for the overall assessment of surface water movement and planning and development of water impoundment within the Nazinga game reserve area and in the arid/semi-arid zones in particular. Aerial photographs and satellite remotely sensed data are useful sources of information for inventorying of surface water potential and the selection of dam sites where climatic and terrain factors favor the use of remotely sensed data. Descriptors: *Aquifers, *Data acquisition, *Geophysical exploration, *Groundwater mining, *Measuring instruments, Computers, Conductivity, Electrical properties, Geologic fractures, Magnetism, Rock properties, SAMTEC 1, SAMTEC 2.

Geoelectrical methods are widely used in groundwater investigations, both in crystalline basements and sedimentary formations. These methods are successful because the electrical conductivity of rocks depends on their water content. In the field of direct current methods, the recent improvement in electronic techniques have lead to a new generation of microprocessor-controlled resistivity meters yielding high quality measurements, displaying the apparent resistivity values directly at the end of the measurement, and capable of storing data in an internal memory. Two field applications described here illustrate the use of electrical methods in groundwater investigations: (1) the search for fracture zones in a crystalline basement using a profiling procedure, and (2) the detection of an aquifer layer at depth using a sounding procedure. For audiomagnetotelluric methods, in which natural currents induced in the ground are detected by measurement of electrical and magnetic components, the Bureau de Recherches Geologiques et Minieres (Orleans, France) has developed two receivers: SAMTEC 1 and SAMTEC 2. Their quality of measurement and ease of use now permit this method to be used in the detection of deep aquifer layers in situations where the use of long-line, direct-current conventional sounding would require high survey costs. Descriptors: *Botswana, *Geohydrology, *Geophysical exploration, *Groundwater resources, *Remote sensing, *Sandstones, *Semiarid lands, Aerial surveys, Aquifers, Kalahari Desert, Regional analysis, Tectonics.

The eastern end of the Kalahari Desert (Botswana) is a sand-covered plateau devoid of any permanent surface water. The region has a mean annual rainfall of 447 mm and a yearly potential evapotranspiration estimated at more than 1220 mm. The main aquifer is the Ntane (formerly Cave) sandstone formation. The regional geological structure of this sandstone aquifer covered by 60 m of Kalahari sand was investigated by a low-level (average altitude 20 m a.g.s.) airborne geophysical survey comprising magnetic and electromagnetic measurements. The results exceeded all expectations. Geological structures such as graben, horsts, dikes, and faults were identified easily. The key to the success of the approach lay in the presence of magnetic units covering the aquifer and intruding below the Kalahari sand. The results enable those areas suitable for future groundwater investigation to be identified with certainty. In such a structurally complex area, surface geophysical studies would have furnished a much more crude and uncertain picture. (See also W91-02288, W91-02332, and W91-02334) (Rochester-PTT)

IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 627-635, 1 ref. English summary.

Descriptors: *Benin, *Data acquisition, *Hydrologic data, *Satellite technology, *Telemetry, ARGOS System, Performance evaluation.

Within the framework of classical hydrometric networks, data collection necessitates frequent visits for maintenance and calibration of the stations. The rapid diffusion of data is hampered by the time needed for its evaluation and transformation to conform to automation requirements as well as its critical assessment. Benefitting from the ARGOS installations combined with the OCP and HYDRONIGER projects, the Hydrological Service of Benin decided to install an automated data gathering and transmission system throughout the country. Measuring instruments and teletransmission devices are mounted on ARGOS buoys. Data are transmitted to an ARGOS satellite and from there to a receiving station in Cotonou. The teletransmitted data are fed automatically into the data bank and the results can be made available to users much more rapidly. The great stability of the buoys and the possibility of observing their operation from a great distance permits a considerable extension of the interval between visits. The time spent in touring the hydrologic network has been reduced to 84 days/yr compared to 222 days/yr under the previous system. (See also W91-02288) (Author's abstract)

Descriptors: *Africa, *Data acquisition, *Data processing, *Hydrologic data, *Network design, *Satellite technology, *Water resources development, ARGOS System, Hydrologic budget, METEOSTAT, Telemetry.

The systematic collection of hydrological data in reference stations of a base hydrometric network permits the evaluation of surface water resources and their annual variations. An exact knowledge of the hydrologic balance of flow maxima and minima is essential for each water resource development. Whatever the nature of the project (e.g., hydropower, water supply for agriculture, urban water supply, bridges, railways, or streets), the adequacy of the existing network needs to be checked to be sure it meets requirements. Systems such as ARGOS and METEOSTAT use teletransmission via satellite to communicate hydrologic data. The hydrologic data is collected by networks of sensors affixed to buoys and transmitted to satellites four to six times a day. From the satellites, the data is transmitted to central receiving stations. (See also W91-02288) (Rochester-PTT)

A World Health Organization program for onchocerciasis control, Onchocerciasis Control Program (OCP), was launched in 1975 in West Africa. Insecticides were sprayed on rivers where vector larvae (Simulium damnosum) reside. About 3,000 to 15,000 km are being treated weekly. To make the campaign efficient without ecological damage it is necessary to know the river discharge at the moment of its treatment. After a pilot study in northern Togo, the OCP decided to employ the ARGOS satellite system in the data acquisition stage. A network of 80 instrument buoys and 2 independent receiver stations has been established. It also was necessary to establish methods for following precisely the propagation of floods and for forecasting the discharge between two buoys and between two messages transmitted. The network and the software used for short-term forecasting of discharge are described. Different forecasting models have been used with this system, E. G. the propagation model (tested with the pilot network in northern Togo), an autorecessive model (also tested on the data from northern Togo) and a model based on the decline in river level. Aerial photography is one of the most valued sources of information for wetland identification and inventory. Highly flexible photogrammetric systems, controlled entirely by PC technology, are currently available to collect primary data and make 3-dimensional measurements directly from the photographs. This study demonstrates the particular suitability of the PC-based analytical plotter, the Carto AP190. It is simple to use, low in cost (US $30,000), accurate (20 microns), flexible to operate (from simple 3-D measurements to GIS data entry), compatible with available software packages and portable for easy installation. This analytical stereoplotter for wetland inventories is an efficient and economical instrument for field office use. (D'Agostino-PTT)

X. Lu, M. Lu, and F. Yin.
Analytical Letters ANALBP, Vol. 23, No. 7, p 1191-1199, July 1990. 3 fig, 1 tab, 9 ref.

Descriptors: *Acetaldehyde, *Chemical analysis, *Luminescence, *Pollutant identification, *Wastewater analysis, *Water analysis, Analytical techniques, Chemical reactions, Detection times, Kinetics, Selectivity, Trace levels, Water pollution.

Chemiluminescent systems have exhibited considerable advantages for the determination of many metal ions and some inorganic compounds, but determination of organic compounds has received much less attention. The chemiluminescent reaction of isopropyl alcohol with ClO(-)-H2O2 (oxychloride-hydrogen peroxide) was found to be enhanced by acetaldehyde. A new chemiluminescent (CL) method for the determination of trace amounts of acetaldehyde was developed. The full chemiluminescent intensity versus time curve, i.e., CL kinetic curve, was recorded. After 4 seconds following the last injection of H2O2 into the reaction cell, the CL intensity reached a maximum and after 8.2 seconds, the CL intensity fell to 50% of the maximum value. Experimental results showed a maximum and constant CL intensity was obtained when the pH of the ClO(-) solution was within 13.2 to 13.6. The detection limit is 0.08 ng/mL acetaldehyde and the linear dynamic range is 0.5 ng/mL to 1000 ng/mL. This method results in good selectivity and has been satisfactorily applied to the determination of traces of acetaldehyde in waste water samples. (VerNooy-PTT)

REMOTE SENSING APPLICATIONS FOR CONSUMPTIVE USE (EVAPOTRANSPIRATION).
Papers Presented at 21st Annual AWRA Conference and Symposium, August 11-16, 1985, Tucson, Arizona. AWRA Monograph Series No. 6, (1985). 72p. Edited by A. I. Johnson and A. Rango.

Descriptors: *Consumptive use, *Data acquisition, *Evapotranspiration, *Remote sensing, *Soil-water-plant relationships, Agriculture, Evaporation, Hydrologic cycle, Symposium, Transpiration.

Consumptive use is defined by the American Geophysical Union as the quantity of water per annum used by either cropped or natural vegetation in transpiration or in the building of plant tissue, together with water evaporated from the adjacent soil, snow or from intercepted precipitation. It is sometimes termed evapotranspiration. In August of 1985, a special session on remote sensing applications for consumptive use was held as part of the 21st Annual Conference of the American Water Resources Association. This monograph contains six papers that were presented at that session. (See W91-02595 thru W91-02600) (Lantz-PTT)

INFORMATION COLLECTION REQUEST FOR: NATIONAL PRIMARY DRINKING WATER REGULATIONS FOR INORGANIC CHEMICALS.
Miller (Wade) Associates, Inc., Arlington, VA.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-192413. Price codes: A03 in paper copy, A01 in microfiche. 6 fig, append. EPA Contract No. 68-03-3348.

Descriptors: *Data acquisition, *Drinking water, *Inorganic compounds, *National Primary Drinking Water Regulat, *Regulations, *Water quality, Asbestos, Barium, Cadmium, Chromium, Copper, Lead, Mercury, Nitrates, Nitrites, Safe Drinking Water Act, Selenium.

The EPA, under the requirements of the Safe Drinking Water Act (Section 1401 and 1412, P.L. 99-339, as amended in 1986, has proposed a National Primary Drinking Water Regulation (NPDWR) pertaining to the contamination of public water systems by inorganic chemical contaminants. The proposed inorganic chemical (IOC) Rule includes information collection requirements for eight inorganic chemicals: asbestos, barium, cadmium, chromium, mercury, nitrate, nitrite, and selenium. This information collection request analyzes the information burden posed on public water systems and States as a result of the regulation. EPA is proposing only to regulate source-related inorganics under this rule, as opposed to inorganics which predominantly occur as corrosion by-products, and naturally occurring copper and lead are analyzed for lead and corrosion by-products. The EPA has already promulgated a NPDWR for fluoride. (Author's abstract)

VOLUNTEER LAKE MONITORING PROGRAM, 1988. VOLUME VI: SOUTHWESTERN ILLINOIS REGION.
Southwestern Illinois Metropolitan and Regional Planning Commission, Collinsville.

S. E. Andres.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-194740. Price codes: A04 in paper copy, A01 in microfiche. April 1989. 43 p, 28 fig, 20 tab.

Descriptors: *Hydrologic data collections, *Illinois, *Lakes, *Monitoring, *Public participation, *Water quality, Aquatic weeds, Coulterville Lake, Data collections, Dunlap Lake, Field tests, Governor Bond Lake, Highland Silver Lake, Holiday Shores Lake, Seasonal variation, Spatial variation, Tower Lake, Transparency, Washington County Lake, Waterloo Reservoir.

This regional report volume is a compilation of lake monitoring data for 11 lakes in the Southwestern Illinois region. Data and analyses are given for those Southwestern Illinois 1988 Volunteer Lake Monitoring Program (VLMP) lakes which were monitored during eight or more sampling periods for the season: Dunlap, Highland Silver, Holiday Shores and Tower Lakes in Madison County; Coulterville Lake in Randolph County; Governor Bond Lake in Bond County; Washington County Lake in Washington County; and Waterloo Reservoir in Monroe County. For each lake, transparency data and field observations are presented and discussed in terms of spatial and seasonal variations. Aquatic weed growth, management activities, and weather conditions are also discussed. Annual transparency trends and management strategies/recommendations are provided. Additional water quality data for Governor Bond and Tower Lakes are provided. Ambient Lake Monitoring Program data are presented and summarized for Highland Silver Lake. Descriptors: *Acoustic telemetry, *Data acquisition, *Data interpretation, *Fish behavior, *Salt marshes, Aquatic habitats, Ponds, Telemetry.

In order to study the activity rhythm and adaptations of fish in a salt marsh under conditions of extensive culture, it was found necessary to use acoustic telemetry. Due to the effective miniaturization of ultrasonic transmitters, it is possible to fit them to relatively small fish. The pulse signals, which are delivered by the transmitter attached to the fish, are picked up by at least three separate hydrophones. As the relative arrival times of the signals transmitted by the fish to the three hydrophones (0, 1 and 2) are recorded, two different propagation times (t1 -t0, t2-t0) are obtained, which allow the position of the fish tagged with the transmitter to be determined. In fact, on a plane surface, the place where the points correspond to a constant difference in time is a hyperbola of which the foci are the two receptive hydrophones. Therefore, the two measured differences in time correspond to two hyperbolae of which one of the points of intersection determines the position of the transmitter in two dimensions. Because the area where experimentation took place was not very deep, < 1.5 m, all movements and positions were recorded in two dimensions. This simplification does not result in any major errors as far as the determination of positions is concerned. Experimental evaluation of the constant of error, as allocated per unit area, enabled estimation of the maximal error in the distance travelled and provided accurate comparison of the swimming activities of different specimens. The tracking system can be satisfactorily used to study fish behavior in ponds, with special reference to habitat utilization and levels of swimming activity linked to natural variations in the environment. Descriptors: *Analytical techniques, *Kjeldahl procedure, *Periphyton, *Proteins, *Wastewater analysis, Ash weight, Chemical analysis, Comparison studies, Hach method, Statistical analysis.

Periphyton ash weight is commonly analyzed as an estimate of entrapped inorganic particulate mass, with the organic component estimated by subtracting the ash weight from the dry weight of the sample. Usually ash weight is determined through ashing of a sample in a muffle furnace. Sometimes, however, the quantity of biomass available for collection is insufficient to permit analysis by muffle-furnace ashing. The portion of a periphyton sample not digested after acid/peroxide digestion during the Hach method of the Kjeldahl procedure for protein nitrogen determination was examined as an estimator of ash weight. This method, used on periphyton biofilms grown in artificial streams and having ash weights in the 200-300 mg/g range, was found to yield results similar but statistically higher and less precise than the ashing technique traditionally employed for ash weight determination. Student's t comparison of paired analyses by the two methods showed no difference at a significance level of alpha = 0.05, provided a constant of 7.6 mg/g is subtracted from results of the digestion method. It is suggested that the technique may be useful where there would otherwise be insufficient sample for ash weight determination. (White-Reimer-PTT)

NEW LIQUID-JUNCTION FREE PROBE FOR THE IN SITU DETERMINATION OF PH, PH2S AND REDOX VALUES.
Kinneret Limnological Lab., Tiberias (Israel).
W. Eckert, T. Frevert, and H. G. Truper.
Water Research WATRAG, Vol. 24, No. 11, p 1341-1346, November 1990. 5 fig, 1 tab, 25 ref.

Descriptors: *Hydrogen ion concentration, *Hydrogen sulfide, *Measuring instruments, *Oxidation-reduction potential, *Water analysis, Comparison studies, Israel, Performance evaluation, Potentiometry, Reference electrodes.

An alternative to the common methods for the in situ determination of pH, pe and pH2S values is presented. The mechanical and electrochemical problems associated with liquid-junction type reference cells for pH and pe measurements can be avoided by using an alkali glass electrode as a reference. The probe was calibrated by comparing it to a precision laboratory pH electrode for a number of lake water samples that were collected at representative depths at the time of the field measurements. Different pe and pH values were adjusted by saturating the test solution with quinhydrone and by the addition of 1 N HCl p.a. A regulated temperature and continuous stirring of the tested solution provided constant conditions during the calibration procedure. The short response time of the pH cell (</= 5s) was attributed to the absence of a liquid-junction, to the favorable sodium conditions and to the direct amplification of the measurement signal. The probe displayed EMF readings irrespective of hydrostatical pressure, temperature gradients and the presence of hydrogen sulfide when it was deployed in Lake Kinneret, Israel. (White-Reimer-PTT)

VELOCITY-DISCHARGE RELATIONSHIPS IN THREE LOWLAND RIVERS.
Sheffield Univ. (England). Dept. of Geography.
A. D. Knighton, and R. Cryer.
Earth Surface Processes and Landforms ESPLDB, Vol. 15, No. 6, p 501-512, September 1990. 5 fig, 3 tab, 18 ref.

Descriptors: *Discharge measurement, *Flow discharge, *Flow velocity, *River flow, *Routing, *Stream discharge, *Stream gaging, Cross-sections, England, Flow models, Hydrologic models.

The use of different functional forms to describe the variation of velocity with discharge was explored for four cross-sections, nine short reaches (100-250 m), and three long reaches (2-7 km) in three lowland rivers in Lincolnshire, England. The traditional log-linear relationship applied to more than half the cases, the degree of correlation never falling below 0.9. Although probably more valid from a physical standpoint, the log-quadratic relationship was only moderately successful, one problem being the position of the vertex relative to bankfull discharge. Alternative formulations based on a kinematic routing model and a partitioned log-linear model were found to have restricted application. Rates of change of velocity with discharge were relatively high in these lowland rivers, not only at-a-station, but also downstream. One explanation is that velocity becomes particularly sensitive to local slope and within-channel vegetation conditions as discharge decreases, resulting in rather low velocities at small discharges. Cross-sectional and reach-based results were compared for neighboring stretches of river. Velocities in short reaches did not differ appreciably from those at nearby cross-sections or from those in long reaches with a length of less than 3 km. By integrating within-reach variability and avoiding the need to choose a representative cross-section, velocity measurement over short reaches is probably preferable to that at cross-sections as a basis for at-a-station hydraulic geometry. COMPUTER-CONTROLLED AUTOMATED RAIN SAMPLER (CCARS) FOR RAINFALL MEASUREMENT AND SEQUENTIAL SAMPLING.
Battelle Pacific Northwest Labs., Richland, WA.
S. D. Tomich, and M. T. Dana.
Journal of Atmospheric and Oceanic Technology JAOTES, Vol. 7, No. 4, p 541-549, August 1990. 5 fig, 3 tab, 1 ref.

Descriptors: *Air pollution, *Automation, *Chemistry of precipitation, *Measuring instruments, *Rain gages, *Water sampling, Computers, Data acquisition, Meteorologic data, Sensors.

Sequential sampling of precipitation events, or subevent sampling, is often desirable for obtaining data relating to the processes whereby pollutants are removed from the atmosphere by precipitation. The Computer-Controlled Automated Rain Sampler (CCARS) is a combination of rain gage and sequential sampler for precipitation chemistry measurements. The primary objectives of the design are low cost, versatility of operational mode, and remote siting using battery power. The three major components of the device are the measuring valve (rain gage), sequential distribution valve, and onboard computer that also serves as a controller and data recorder. The measuring valve uses an electromagnetically-operated plunger and optical sensors to divide rain events into adjustable rainfall increments (nominally 0.01 in). The distribution valve, using a stepping motor and a rotating channeled gear, delivers programmed volumes to nine sequential stages. The computer records rain and stage increment timing and can be programmed to sample on a time or volume basis. (Author's abstract)

OBSERVATIONS ON THE DEVELOPMENT OF PORE-WATER STRESSES DURING PIEZOCONE PENETRATION IN CLAYS.
Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
P. W. Mayne, F. H. Kulhawy, and J. N. Kay.
Canadian Geotechnical Journal CGJOAH, Vol. 27, No. 4, p 418-428, August 1990. 5 fig, 2 tab, 69 ref. Electric Power Research Institute (EPRI) Contract RP1493-4.

Descriptors: *Clays, *Compaction, *Geologic fractures, *Instrumentation, *Interstitial water, *Penetrometers, *Piezocone penetration, *Piezometers, *Pore water, Mathematical models.

Piezocone data from 83 clay sites were reviewed to investigate first-order trends between measured penetration pore-water stresses (u-t and u-bt) and corrected cone-tip resistance (q-t). The presence of fissures in clay deposits and of fissured crusts significantly affected the pore water stress response. Commercially available piezocones favored the location of the porous element either on the tip or face (u-t) or just behind the tip (u-bt). U-t provided optimal profiling while u-bt was required for correcting measured cone-tip resistances for pore-water stress effects acting on unequal areas of the cone. The available data indicated that q-t predominantly reflected penetration pore-water stresses (u-t) with measured ratios of u-t/q-t on the cone face averaging in the order of 0.73 for most intact clays, 0.64 specifically for Leda clays, and 0.46 for fissured clays. Behind the cone tip, the ratio of u-bt/q-t averaged about 0.53 for intact clays, 0.58 specifically for Leda clays, and near zero or slightly negative for heavily overconsolidated fissured clays. SIMULATION OF DOWNHOLE AND CROSSHOLE SEISMIC TESTS ON SAND USING THE HYDRAULIC GRADIENT SIMILITUDE METHOD.
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
L. Yan, and P. M. Byrne.
Canadian Geotechnical Journal CGJOAH, Vol. 27, No. 4, p 441-460, August 1990. 29 fig, 1 tab, 40 ref, 2 append.

Descriptors: *Anisotropy, *Earthquake engineering, *Mathematical models, *Model studies, *Seismic properties, *Seismic waves, *Seismology, *Soil dynamics, *Soil physics, *Stress, Electrical equipment, Model testing, Piezometers, Sand.

A method of simulating downhole and crosshole seismic shear-wave tests in a model under controlled stress conditions is presented. The downhole and shear wave in horizontal plane (SH) crosshole shear waves were generated and received along the principal stress axes using piezoceramic bender elements. The K-(o) in situ stress conditions, including loading and unloading stress paths, were simulated by the hydraulic gradient similitude method, which allow stresses simulating field conditions to be obtained. The horizontal stress during the tests was directly measured by a lateral total-stress transducer. The test data were used to evaluate various published empirical equations that related shear-wave velocity and soil stress state. Although the various empirical equations could predict the in situ shear-wave velocity profile reasonably well, only the equation that relates the shear-wave velocity to the individual principal stresses in the directions of wave propagation and particle motion could predict the variation of the velocity ratio between the downhole and SH crosshole tests. Also, the stress ratio had some effects on the downhole (or shear wave in vertical plane (SV) crosshole) shear-wave velocity, but not on the SH crosshole shear-wave velocity. Comparison between the downhole and SH crosshole showed that structure anisotropy was in the order of 10%. In addition, K-o values were predicted from shear-wave measurement and compared with measured ones. The difficulties in obtaining K-(o) values from shear-wave measurement are also presented. PROPOSED FRAMEWORK AND DATABASE FOR EIA AUDITING.
Murdoch Univ. (Western Australia). School of Biological and Environmental Sciences.
J. Bailey, and V. Hobbs.
Journal of Environmental Management JEVMAW, Vol. 31, No. 2, p 163-172, September 1990. 2 fig, 9 ref.

Descriptors: *Assessments, *Auditing, *Australia, *Data storage and retrieval, *Databases, *Decision making, *Environmental impact, Canals, Environmental policy, Marinas.

Environmental impact assessment (EIA) is intended to provide decision-makers with an understanding of the probable environmental consequences of a proposed project or course of action, and thereby facilitate the making of better environmental decisions. Recently, there has been an upsurge of interest in examining the effectiveness of EIA, and a recognition of the need to introduce feedback into the process to learn from experience. This process is known as auditing, one of the fastest growing areas in the field of EIA. A framework for EIA auditing which focuses on the overall process of EIA rather than the separate analysis of particular stages is presented. The framework was developed through auditing several canal and marina developments in Western Australia and is closely linked to this area's procedures. Data obtained from EIA documentation was used to construct a database of four files which summarize the EIA concepts of proposed actions, imposed environmental conditions, predicted impacts, and observed impacts. The database can be used to undertake an implementation audit, a project impact audit, or a predictive techniques audit. It also allows individual audits to be evaluated within the wider context of the overall effectiveness of the EIA system. The database has applications at both the academic and practical levels of EIA auditing. (Medina-PTT)

ANALYSIS BY FUNCTIONS APPLIED TO HYDROMETRY (L'ANALYSE PAR FONCTIONS APPLICATION A 'HYDROMETRIE).
Agence Financiere de Bassin Seine-Normandie, Paris (France).
F. Guerber.
Houille Blanche HOBLAB, Vol. 1990, No. 5, p 363-374, 1990. 2 fig, 3 tab, 5 ref, 2 append. English summary.

Descriptors: *Data interpretation, *Data storage and retrieval, *Hydrometry, *Information exchange, Armancon Basin, France, Mathematical analysis, Network design, Project planning.

Quantified information is becoming more and more necessary for knowing and restoring the natural environment. This information must be gathered during long observation periods, and used by various institutions with various objectives. This is why it is difficult to rationalize the production, storage and diffusion of environmental information. Analysis by function is one method which contributes to this effort of rationalization, by defining the concepts of fields and functions. This method is described, and illustrated with a case using hydrometric data. The method resutls in some quantification, which may help measurement networks and data banks to become better able to satisfy the needs of their users. Applied to the concrete case of the Armancon basin, the method helps to justify, both technically and financially, project plans to develop a hydrometric measure network. (Author's abstract)

RATIOS IN AQUATIC SCIENCES: STATISTICAL SHORTCOMINGS WITH MEAN DEPTH AND THE MORPHOEDAPHIC INDEX.
Toronto Univ. (Ontario). Dept. of Zoology.
D. A. Jackson, H. H. Harvey, and K. M. Somers.
Canadian Journal of Fisheries and Aquatic Sciences CJFSDX, Vol. 47, No. 9, p 1788-1795, September 1990. 5 fig, 1 tab, 40 ref.

Descriptors: *Lake morphometry, *Model studies, *Morphoedaphic index, *Statistical analysis, Abundance, Biomass, Fish populations, Productivity, Water depth.

Researchers in aquatic sciences frequently employ empirically derived models to predict productivity, yield and abundance of fish. Three normally distributed variables, each with a mean of 100 and standard deviation of 30, were generated, and common ratios (biomass versus total lake area, biomass per unit area (BPUA) vs. lake area, BPUA vs. lake mean depth, BPUA vs. the inverse of mean depth, and log BPUA vs. log mean depth) were calculated. Pearson product-moment correlations and Spearman rank correlations were used to assess the strength of the associations between variables. To determine the probability of rejecting the null hypothesis for each of these correlations, randomization tests were used. Ten data sets were selected from the literature for ratio generation and comparison with the simulations. Predictive models employing ratios of standardized biomass and lake morphometric variables are biased by spurious correlations due to mathematical transformations and the use of inappropriate null models. Studies incorporating ratios like mean depth or the morphoedaphic index require cautious interpretation. Future research should focus on more appropriate analytical approaches such as regression-based models (the analysis of covariance). Alternatively, where ratios are employed and spurious correlations are likely, statistical evaluations must incorporate randomization tests to assess the significance of such results. (Brunone-PTT)

MESIP: MODELLING ENVIRONMENTAL SCENARIOS IN PONDS.
Bayreuth Univ. (Germany, F.R.). Chair of Ecological Chemistry and Geochemistry.
K. W. Shramm, and K. U. Goss.
Toxicological and Environmental Chemistry TXECBP, Vol. 26, No. 1/4, p 123-128, 1990. 5 fig, 2 tab.

Descriptors: *Biodegradation, *Computer models, *Fate of pollutants, *MESIP model, *Model studies, *Organic chemicals, *Path of pollutants, *Ponds, Advection, Chemical processes, Diffusion, Dissolved oxygen, Solute transport.

MESIP is a fugacity model which can predict the fate of organic chemicals in aquatic ecosystems. Aquatic ecosystems are divided into air, water, suspended matter, 4 sediment layers, and biological growth on the pond walls. All compartments are considered to be well-mixed. Two types of transport phenomena are considered. Mass exchange between compartments is assumed to be a diffusion type process. The transport kinetics across the interphases are dependent upon the corresponding transfer coefficients and the fugacity differences represent the driving forces between the compartments. Advection is assumed to be responsible for import and export of substances into and out of each compartment. Degradation/transformation processes are important aspects of the model. Photolytic, hydrolytic, biological, and oxidation/reduction processes are assumed to be a pseudo first-order kinetic. The constants are corrected by additional time dependent parameters which characterize the different conditions in each compartment, including light intensity, pH, ATP/DOC, and oxygen concentration. Comparison of the calculated and measured fate of a fluorescent whitening compound in an artificial outdoor pond indicated an underestimation of transport due to the presence of a biological film on the top sediment layer. APPROXIMATION OF CONFIDENCE LIMITS ON SAMPLE SEMIVARIOGRAMS FROM SINGLE REALIZATIONS OF SPATIALLY CORRELATED RANDOM FIELDS.
Illinois State Water Survey Div., Champaign. Ground-Water Section.
J. M. Shafer, and M. D. Varljen.
Water Resources Research WRERAQ, Vol. 26, No. 8, p 1787-1802, August 1990. 21 fig, 1 tab, 39 ref.

Descriptors: *Confidence limits, *Correlation analysis, *Environmental data, *Geostatistics, *Network design, *Statistical analysis, *Statistical methods, Spatial distribution, Uncertainty.

A fundamental requirement for geostatistical analyses of spatially correlated environmental data is the estimation of the sample semivariogram to characterize spatial correlation. Selecting an underlying theoretical semivariogram based upon the sample semivariogram is an extremely important and difficult task that is subject to a great deal of uncertainty. Current standard practice does not involve consideration of the confidence associated with semivariogram estimates, largely because classical statistical theory does not provide the capability to construct confidence limits from single realizations of correlated data, and multiple realizations of environmental fields are not found in nature. The jackknife method is a nonparametric statistical technique for parameter estimation that may be used to estimate the semivariogram. When used in connection with standard confidence procedures, it allows for the calculation of closely approximate confidence limits on the semivariogram from single realizations of spatially correlated data. The accuracy and validity of this technique was verified using a Monte Carlo simulation approach which enabled confidence limits about the semivariogram estimate to be calculated from many synthetically generated realizations of a random field with a known correlation structure. The synthetically derived confidence limits were then compared to jackknife estimates from single realizations with favorable results. Finally, the methodology for applying the jackknife method to a real-world problem and an example of the utility of semivariogram confidence limits were demonstrated by constructing confidence limits on seasonal sample variograms of nitrate-nitrogen concentrations in shallow groundwater in an approximately 12 square mile region in northern Illinois. In this application, the confidence limits on sample semivariograms from different time periods were used to evaluate the significance of temporal change in spatial correlation. This capability is quite important as it can indicate when a spatially optimized monitoring network would need to be reevaluated and thus lead to more robust monitoring strategies. Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4044, 1990. 1 sheet, 1 tab, 9 ref.

Descriptors: *Groundwater resources, *Selective withdrawal, *Texas, *Water resources data, *Water use, Maps, Surface water.

Freshwater withdrawal data was compiled for the 254 counties in Texas for 1985. Major categories of withdrawal are presented by county on maps of the State. Withdrawals are also shown by source, aquifer, and major river basin. Total freshwater withdrawals in Texas during 1985 were about 20,100 million gal/day. Surface-water withdrawals were about 12,900 million gal/day or 64% of the total, and groundwater withdrawals were about 7,190 million gal/day or 36% of the total. More water was withdrawn for irrigation than for any other purpose, accounting for 40% of total freshwater withdrawals and for 75% of groundwater withdrawals. (USGS)

L. J. Combs.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 89-592, 1989. 96p, 11 fig, 6 tab, 46 ref.

Descriptors: *Data acquisition, *Data collections, *Groundwater data, *Hydrologic data collections,

*Kansas, *Water resources data, Information exchange, Surface water data, Water quality data.

The principal mission of the U.S. Geological Survey, Water Resources Division, in Kansas is to investigate the occurrence, quantity, quality, distribution, and movement of surface and groundwater throughout the State. Primary activities include the systematic collection, analysis, and interpretation of hydrologic data, evaluation of water demands, and water resources research. Hydrologic investigations are conducted through four types of studies: (1) data collection programs; (2) statewide or regional investigations; (3) local or area investigations; and (4) research. These studies are funded through cooperative agreements with State and local agencies, transfer of funds from other agencies, and direct Federal funds. Thirty-six water related studies were ongoing during fiscal years 1987 and 1988 in Kansas. This report describes for each study the problem that initiated the study, the objectives of the study, the approach designed to achieve the objectives, and significant milestones and publications that resulted during fiscal years 1987 and 1988. Information on more than 2,100 data collection stations in Kansas is presented in maps and tables. A list of 46 reports and abstracts published or released by the U.S. Geological Survey, its cooperators, or technical and scientific organizations during 1987 and 1988 is provided. (USGS)
W91-02236

WATER RESOURCES DATA FOR FLORIDA, WATER YEAR 1989, VOLUME 3B: SOUTHWEST FLORIDA GROUND WATER.
Geological Survey, Tampa, FL. Water Resources Div.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-244773. Price codes: A15 in paper copy; A02 in microfiche. USGS Water Data Report FL-89-3B. USGS/WRD/HD-90/267, 1990, 327p. Prepared in cooperation with the State of Florida and other agencies.

Descriptors: *Florida, *Groundwater, *Hydrologic data, *Surface water, *Water quality, Chemical analysis, Data collections, Elevation, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Water analysis, Water level, Water temperature, Water wells.

Water resources data for the 1989 water year for Florida consist of continuous or daily discharge for 295 streams, periodic discharge for 36 streams, miscellaneous discharge for 75 streams, continuous or daily stage for 154 streams, continuous daily tide stage for 12 sites, periodic stage for 13 streams, peak discharge for 57 streams, and peak stage for 30 streams; continuous or daily elevations for 73 lakes, periodic elevations for 72 lakes; continuous groundwater levels for 514 wells, periodic groundwater levels for 798 wells and miscellaneous water level measurements for 2687 wells; quality of water data for 149 surface-water sites and 827 wells. The data for southwest Florida include records of stage, discharge, and water quality of streams; stage, contents, water quality of lakes and reservoirs, and water levels and water quality of groundwater wells. Volume 3B contains records for continuous groundwater elevations for 200 wells; periodic groundwater elevations at 126 wells; miscellaneous groundwater elevations at 47 wells; and water quality at 167 groundwater sites. These data represent the national Water Data System records collected by the U.S. Geological Survey and cooperating local, state, and federal agencies in Florida. (USGS)
W91-02240

WATER RESOURCES DATA FOR UTAH, WATER YEAR 1989.
Geological Survey, Salt Lake City, UT. Water Resources Div.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-239849/AS. Price codes: A17 in paper copy; A03 in microfiche. USGS Water Data Report UT-89-1. USGS/WRD/HD-90/272, 1990, 383p. Prepared in cooperation with the State of Utah and with other agencies.

Descriptors: *Groundwater, *Hydrologic data, *Surface water, *Utah, *Water quality, Chemical analysis, Data collections, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Water analysis, Water level, Water temperature, Water wells.

Water resources data for the 1989 water year for Utah consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water quality of groundwater. This report contains discharge records for 185 gaging stations; stage and contents for 22 lakes and reservoirs; water quality for 21 hydrologic stations and 217 wells; miscellaneous temperature measurements and field determinations for 147 stations; and water levels for 29 observation wells. Additional water data were collected at various sites not involved in the systematic data collection program, and are published as miscellaneous measurements. These data represent the national Water Data System records collected by the U.S. Geological Survey and cooperating State and Federal agencies in Utah. (USGS)
W91-02241

PREPARATION OF AVERAGE ANNUAL RUNOFF MAP OF THE UNITED STATES, 1951-80.
Geological Survey, Madison, WI. Water Resources Div.
W. R. Krug, W. A. Gebert, and D. J. Graczyk.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 87-535, 1990. 414p, 2 tab, 8 ref.

Descriptors: *Data collections, *Hydrologic data, *Maps, *Runoff, *Stream discharge, Correlation analysis, Gaging stations.

Average annual runoff was computed or estimated for 2,148 hydrologic cataloging units in the United States and Puerto Rico, for the period 1951-80. Runoff was computed from the recorded streamflow at 5,951 U.S. Geological Survey gaging stations. The runoff at more than 3,000 of these stations was estimated by correlation with other nearby stations to adjust for missing data. These runoff data were used to draw a map depicting the variation of runoff throughout the nation. Average annual runoff varied from less than 0.01 inch in parts of the Great Basin (Utah, parts of Nevada, Oregon, and California) to more than 240 inches in southeastern Alaska. (USGS)
W91-02247

GROUND-WATER LEVELS IN ARKANSAS, SPRING 1990.
Geological Survey, Little Rock, AR. Water Resources Div.
P. W. Westerfield.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 90-377, 1990. 62p, 5 fig, 16 tab, 42 ref.

Descriptors: *Arkansas, *Data collections, *Groundwater level, *Hydrologic data, Aquifers, Well hydrographs.

Groundwater level measurements were made in 553 wells in Arkansas in the spring of 1990. These data are listed in tables by aquifer; then by county. For each surface, the altitude of the land surface, the data measured, the depth to the water surface, and the altitude of the water surface are reported. Also reported are the net changes in water levels between 1989 and 1990 and between 1985 and 1990. This report also contains maps showing the average water level change, by county, between the years 1985 and 1990 for the aquifers in the Quaternary deposits and the Sparta and Memphis Sands. Hydrographs are included for selected wells completed in the aquifers in the Quaternary deposits and the Sparta and Memphis Sands. (USGS)

FATHOMETER DATA FROM BART LAKE AND LAKE DOROTHY NEAR JUNEAU, ALASKA, 1988-89.
Geological Survey, Anchorage, AK. Water Resources Div.
H. R. Seitz, and D. S. Thomas.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 90-152, 1990. 14p, 11 fig, 5 ref.

Descriptors: *Alaska, *Bathymetry, *Hydroelectric power, *Lakes, *Water resources data, Fathometers, Juneau, Water depth.

Lake Dorothy is located about 20 miles southeast of Juneau, Alaska in an undeveloped area south of Taku Inlet. It occupies a linear, glacially eroded depression at an altitude of 2,400 ft. Several studies have assessed the feasibility of hydropower generation by a tap of Lake Dorothy. One of the proposed alignments, a tunnel to transmit water from lake Dorothy to a powerhouse at tide water on Taku Inlet, crosses Bart Lake, a cirque lake at 986 ft altitude. Fathometer surveys show that Bart Lake is a relatively symmetrical bowl-shaped depression with a maximum depth of 543 ft, and Lake Dorothy is a north-south elongated depression with steep sides and a maximum depth of 569 ft. (USGS)
W91-02254

DIFFERENCE BETWEEN THE POTENTIOMETRIC SURFACE OF THE AQUIA AQUIFER OF SEPTEMBER 1986 AND SEPTEMBER 1988 IN SOUTHERN MARYLAND.
Geological Survey, Towson, MD. Water Resources Div.
F. K. Mack, D. C. Andreasen, S. E. Curtin, and J. C. Wheeler.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 90-4039, 1990. 1p, 1 fig.

Descriptors: *Aquia Aquifer, *Artesian aquifers, *Coastal plains, *Maps, *Maryland, *Potentiometric level, Anne Arundel County, Calvert County, Charles County, Groundwater level, Prince Georges County, St Marys County.

A map was prepared that shows the net change in the potentiometric surface of the Aquia aquifer (in the Paleocene Aquia Formation) in southern Maryland from the fall of 1986 to the fall of 1988. The map, based on water level measurements from 74 observation wells, shows that during the 2 year period the potentiometric surface declined less than 6 ft in most of southern Maryland but 10 ft or more in the Lexington Park and Solomons Island areas. (USGS)
W91-02255

DIFFERENCE BETWEEN THE POTENTIOMETRIC SURFACE OF THE MAGOTHY AQUIFER OF SEPTEMBER 1986 AND SEPTEMBER 1988 IN SOUTHERN MARYLAND.
Geological Survey, Towson, MD. Water Resources Div.
F. K. Mack, D. C. Andreasen, S. E. Curtin, and J. C. Wheeler.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 90-4038, 1990. 1p, 1 fig.

Descriptors: *Artesian aquifers, *Coastal plains, *Magothy Aquifer, *Maps, *Maryland, *Potentiometric level, Anne Arundel County, Calvert County, Charles County, Groundwater level, Maryland Coastal Plain, Prince Georges County.

A map was prepared that shows the net change in the potentiometric surface of the Magothy aquifer (in the Cretaceous Magothy Formation) in southern Maryland from the fall of 1986 to the fall of 1988. The map, based on water level measurements from 79 observation wells, shows that during the 2 year period the potentiometric surface declined less than 5 ft in most of the northern part of the study area and more than 10 ft in a 4-sq-mi area in

northern Charles County. Net water-level rises of as much as 2 ft were measured in central Charles County. (USGS)
W91-02256

POTENTIOMETRIC SURFACE OF THE AQUIA AQUIFER IN SOUTHERN MARYLAND DURING SEPTEMBER 1988.
Geological Survey, Towson, MD. Water Resources Div.
F. K. Mack, D. C. Andreasen, S. E. Curtin, and J. C. Wheeler.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 90-4037, 1990. 1p, 1 fig.

Descriptors: *Aquia Aquifer, *Artesian aquifers, *Coastal plains, *Maps, *Maryland, *Potentiometric level, Anne Arundel County, Calvert County, Charles County, Groundwater level, Maryland Coastal Plain, Prince Georges County.

A map showing the potentiometric surface of the Aquia aquifer in the Paleocene Aquia Formation in southern Maryland during the fall of 1988 was constructed on the basis of water level measurements made at 84 observation wells. The potentiometric surface was above sea level near the northwestern boundary and outcrop area of the aquifer in topographically high areas of Anne Arundel and Prince Georges Counties; it was below sea level in the remainder of the study area. The hydraulic gradient generally was to the southeast toward an extensive cone of depression centered around well fields near Lexington Park and Solomons Island. Water levels were more than 60 ft below sea level in a 50 sq-mi area near the center of the cone and were more than 100 ft below sea level at two of the wells near the center of the cone. (USGS)
W91-02257

WATER RESOURCES ACTIVITIES IN FLORIDA, 1989-90.
Geological Survey, Tallahassee, FL. Water Resources Div.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 90-169, 1990. 92p, 6 fig. Edited by M. E. Glenn.

Descriptors: *Projects, *Publications, Data collections, Handbooks, Hydrologic data.

This report contains 62 summary statements of water resources activities in Florida conducted by the Water Resources Division of the U.S. Geological Survey in cooperation with Federal, State, and local agencies during 1989-90. These activities are part of the Federal program of appraising the Nation's water resources. (USGS)
W91-02258

ACTIVITIES OF THE ALASKA DISTRICT, WATER RESOURCES DIVISION, U. S. GEOLOGICAL SURVEY, 1990.
Geological Survey, Anchorage, AK. Water Resources Div.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 90-157, 1990. 21p. E. F. Snyder, compiler.

Descriptors: *Alaska, *Data collections, *Hydrologic data, *Water resources data, Bibliographies, Groundwater, Hydrology, Project planning, Surface water, Water quality.

Thirteen projects of the U.S. Geological Survey, Water Resource Division active in Alaska in 1990 are described. Each description includes information on period of project, chief, funding sources, location, purpose, current status, and published or planned reports. The compilation also contains a bibliography of reports published by the Alaska District from 1987 through January 1990. (USGS)

WATER RESOURCES DATA FOR ARKANSAS, WATER YEAR 1989.
Geological Survey, Little Rock, AR. Water Resources Div.
M. A. Moore, J. E. Porter, P. W. Westerfield, and K. Young.
Available from the National Technical Information Service, Springfield, VA 22161 as PB90-266339. Price codes: A25 in paper copy, A04 in microfiche. USGS Water-Data Report WDR-AR-89-1. WRD/HD-90/261, 1990. 581p. Prepared in cooperation with the State of Arkansas and with other agencies.

Descriptors: *Arkansas, *Data collections, *Groundwater, *Hydrologic data, *Surface water, *Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Sampling sites, Sediments, Water analysis, Water level, Water temperature.

The Water Resources Division of the U.S. Geological Survey, in cooperation with State, Federal, and other local governmental agencies, obtains a large amount of data pertaining to the water resources of Arkansas each water year. These data, accumulated during many water years, constitute a valuable data base for developing an improved understanding of the water resources of the State. Water resources data for the 1989 water year for Arkansas consist of records of gage height, discharge, and water quality of streams; water quality of lakes; water levels, and water quality of observation wells. This report contains discharge records for 54 gaging stations; water-quality data for 160 regular water-quality stations, 65 partial-record water-quality stations, 4 observation wells, and 1 precipitation station; water-level measurements for 89 observation wells. Also included are data for 81 crest-stage partial-record surface-water stations. Additional water data were collected at various sites, not part of the systematic data collection program, and are published as low-flow and miscellaneous measurements. These data represent that part of the National Water Information System operated by the U.S. Geological Survey in cooperation with State and Federal agencies in Arkansas. (See also W90-06282) (USGS)

PROBLEM OF WATER BALANCE MODELLING UNDER SEMI-ARID CONDITIONS.
Oslo Univ. (Norway). Inst. of Geophysics.
E. Langsholt, and L. Gottschalk.
IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 242-254, 6 fig, 1 tab, 11 ref.

Descriptors: *Botswana, *Hydrologic budget, *Hydrologic models, *Model studies, *Semiarid lands, Comparison studies, Mahalapswe catchment, Mathematical models, Rainfall-runoff relationships, Spatial variation, Temporal variation.

Analyses were conducted of hydrological data from the Mahalapswe catchment in Botswana in an attempt to see how conceptual models developed mainly under humid conditions perform in semi-arid climates and how the characteristics of precipitation influence modeling accuracy. Meteorological and hydrological variables in semi-arid areas are characterized by extreme temporal and spatial variability, but quantitative knowledge about this variability is rather poor. The accuracy in estimated areal precipitation was determined from the distance correlation of rain events, showing the relation between absolute mean square error and the density of the observation station network. The analysis was carried out for time periods of different length. A model study was conducted using precipitation and runoff data from the same catchment to study the effect of the above factors on model calculations of runoff. Several conceptual water balance models with different degrees of complexity in model structure and spatial averaging of precipitation were used. The results seem to support the principle that when information available is not limited with respect to quantity and quality it may not pay to try to describe the true complexities present in a given situation. SOME EXAMPLES OF IMPORTANT PROBLEMS CONNECTED TO RAINFALL-RUNOFF MODELLING IN SEMI-ARID ZONE.
Lund Univ. (Sweden). Dept. of Water Resources Engineering.
J. Niemczynowicz.
IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 255-266, 4 fig, 14 ref.

Descriptors: *Hydrologic models, *Model studies, *Rainfall-runoff relationships, *Semiarid lands, *Tunisia, Climates, Evaporation, Mathematical models, Rural areas, Soils, Topography, Urban areas.

Several hydrological research projects have been conducted in Tunisia in cooperation between the Ministry of Higher Education in Tunis, Tunisia, and the University of Lund, Sweden. Mathematical modeling of rainfall-runoff processes on both urban and rural catchments was an important part of these projects. Problems that occurred forced the questioning of assumptions and mathematical formulations behind rainfall-runoff models originally developed for application in a humid climate. A second question confronted was how to modify and adapt these models to climatological, geological, topographical, and hydrological conditions specific for the semi-arid zone. One conclusion drawn from trying to apply these models to the semi-arid climate of Tunis was that an obvious improvement in the applicability of the model to semi-arid regions can be achieved by refining the mathematical formulation of the processes that are most important to the region. Existence of differences in soil type, topography, and rainfall pattern suggest that such processes as infiltration, soil moisture storage, rainfall spatial distribution, evaporation, and groundwater recharge must be studied carefully to find governing relationships and thus enable improvement of the mathematical formulation of these processes. USE OF PERSONAL COMPUTERS FOR THE ANALYSIS AND MANAGEMENT OF HYDROMETEOROLOGICAL AND GROUNDWATER DATA.
Institute of Hydrology, Wallingford (England).
F. A. K. Farquharson, and C. S. Green.
IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 772-782, 4 fig, 1 ref.

Descriptors: *Africa, *Computer programs, *Data processing, *Groundwater data, *Hydrologic data, Microcomputers, *Water resources management, Arid lands, GRIPS, HYDATA, Hydrometeorology, Performance evaluation, Semiarid lands.

Much of Africa has an arid or semi-arid climate and experiences wide variations in annual rainfall and river discharges. Much of the current groundwater abstraction is of fossil water, which is not being renewed by recharge. Better management of the fragile water resources within this region requires very careful monitoring and analysis of the hydrometeorological and hydrological data. Modern personal computers (PCs) are relatively cheap but are surprisingly reliable and offer considerable data storage and computing power. Two software systems were developed for analysis of water resources data on PCs. HYDATA is designed for storage and analysis of data on rainfall, climate, river level and flow, reservoir storage and general information, such as evaporation and temperature. GRIPS (GRoundwater Information Processing System) is for storage and analysis of all types of data encountered in hydrogeological studies (station locations, water levels, lithology, pumping tests, water chemistry, isotopes, etc.). The software was developed by hydrologists and hydrogeologists who have years of first-hand, practical experience working in Africa. The software is designed to be robust, error free, and easy to use by the unskilled and poorly trained staff who may never have seen or used a computer before. The two software systems have been fully tested and HYDATA has been used in 16 countries, whereas the GRIPS has been used in six countries. (See also W91-02288) (Author's abstract)

ARRIVAL OF A GENERATION OF FIELD EXPERT SYSTEMS (L'AVENEMENT D'UNE GENERATION DE SYSTEMES EXPERTES DE TERRAIN).
HYDROLOG S.A., Gentilly (France).
J. Poyet, and M. Detay.
IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 800-811, 39 ref. English summary.

Descriptors: *Africa, *Cameroon, *Computers, *Developing countries, *Expert systems, *Sampling, *Water supply development, *Wells, Drilling, Field tests, HYDROLAB, Rural areas, Surveys.

A first field expert system for village water supply has been developed to operate on portable personal computers. HYDROLAB embodies the major techniques used by experts in the field and draws on a considerable wealth of practical knowledge gained from numerous drilling campaigns that were carried out in Africa, particularly in North Cameroon. For any case, the system can make a diagnosis about the user's situation, give advice in order to increase his average success, estimate the drilling risk, and evaluate the hydrodynamic characteristics of the proposed well. SUPERCOMPUTERS AND THEIR USE IN MODELING SUBSURFACE SOLUTE TRANSPORT.
Western Australia Univ., Nedlands. Centre for Water Research.
D. A. Barry.
Reviews of Geophysics RVGPB4, Vol. 28, No. 3, p 277-295, August 1990. 2 fig, 128 ref.

Descriptors: *Computer models, *Computers, *Groundwater movement, *Hydrologic models, *Literature review, *Model studies, *Simulation analysis, *Solute transport, *Supercomputers, Algorithms, Data interpretation, Mathematical models, Numerical analysis, Stochastic hydrology.

A literature review of recent applications of supercomputers to solute transport problems is presented. These applications are based mostly on the assumption of a dilute solute, allowing the governing equations to be decoupled. An application of supercomputers is the simulation of solute transport in large heterogeneous spatial domains by both direct solution of the governing equations and by particle-tracking methods. One impetus for this research has been the rapid increase in predictive dispersion models based on analytical stochastic theory. Up until now, relatively few applications have incorporated algorithms designed with a targeted supercomputer in mind, with the result that the machine's potential has not been exploited fully. Since many numerical problems are reduced to solutions of algebraic systems when they are implemented on computers, algorithms for linear algebraic systems of equations suitable for vector and parallel machines are discussed in some detail. Data analysis, necessary both for evaluating emerging theories and for more routine applications such as determining model parameters, is identified as another general area that is ably handled by supercomputers. In particular, supercomputers offer a way to become less dependent on parametric assumptions and constraints, substituting instead raw computational power. Visualization techniques and associated facilities have flourished alongside the development of supercomputer centers. These offer the possibility for real-time viewing of solute transport processes, both real and simulated, although little has been produced thus far. It is expected that many more researchers involved with subsurface solute transport will make use of supercomputers in the future. (Author's abstract)

USING SATELLITE DATA FOR MAPPING AND MONITORING VEGETATION RESOURCES.
R. H. Haas.
IN: Remote Sensing Applications for Consumptive Use (Evapotranspiration). Papers Presented at 21st Annual AWRA Conference and Symposium, August 11-16, 1985, Tucson, Arizona. AWRA Monograph Series No. 6, (1985). p 51-64, 5 fig, 6 tab, 12 ref. USGS Contract No. 14-08-0001-20129.

Descriptors: *Landsat images, *Mapping, *Satellite technology, *Vegetation, Data acquisition, Data interpretation, Monitoring, Remote sensing, Resources management, Spectral analysis, Wyoming.

Landsat multispectral scanner data are being used to map vegetation at a level useful to natural resource managers. A study conducted in the Big Horn Basin of north-central Wyoming demon-

strates techniques that are helpful in producing a Landsat derived land cover map. Spectral stratification was used to gain precision in the use of the satellite data for mapping natural terrestrial vegetation in a hierarchical physiognomic classification framework. Landsat spectral data were readily registered to a map base, and became an information source for this geographic information system application. Procedures were developed for mapping range capability classes with the Landsat derived vegetation and digitized soils data. The study suggests that the soil/vegetation landscape polygon could be used for monitoring changes in vegetative cover. The resulting change detection could be used in monitoring the status of land cover on large areas at minimal cost. (See also W91-02594) (Author's abstract)

WATER RESOURCES FOR CALIFORNIA, WATER YEAR 1989, VOLUME 3. SOUTHERN CENTRAL VALLEY BASINS AND THE GREAT BASIN FROM WALKER RIVER TO TRUCKEE RIVER.
Geological Survey, Sacramento, CA. Water Resources Div.
S. W. Anderson, T. C. Hunter, and J. R. Mullen.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-258112/AS. Price codes: A19 in paper copy, A03 in microfiche. USGS Water-Data Report CA-89-3 (USGS/WRD/HD-90/284), 1990. 417p. Prepared in cooperation with the California Department of Water Resources and with other agencies.

Descriptors: *California, *Data collections, *Hydrologic data, *Surface water, *Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Water analysis, Water temperature.

Water resources data for the 1989 water year for California consist of records of stage, discharge, and water quality of streams; stage and contents in lakes and reservoirs; and water levels and water quality in wells. Volume 3 contains discharge records for 182 gaging stations; stage and water contents for 47 lakes and reservoirs; water quality for 37 stations; and 3 crest-stage partial-record stations. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in California. (USGS)

Available from National Technical Information Service, Springfield, VA 22161 as PB90-266289. Price codes. A15 in paper copy, A02 in microfiche. Water-Data Report CA-89-4 (USGS/WRD/HD-90/301), 1990. 315p. Prepared in cooperation with the California Department of Water Resources and with other agencies.

Descriptors: *California, *Data collections, *Groundwater, *Hydrologic data, *Surface water, *Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Water analysis, Water temperature.

Water resources data for the 1989 water year for California consist of records of stage, discharge, and water quality of streams; stage and contents in lakes and reservoirs; and water levels and water quality in wells. Volume 4 contains discharge records for 177 gaging stations; stage and water contents for 34 lakes and reservoirs; precipitation data for 3 stations; and water quality for 9 stations. Also included is one low-flow partial-record station. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in California. (See also W90-06302) (USGS)
W91-02628

WATER RESOURCES DATA FOR MASSACHUSETTS AND RHODE ISLAND, WATER YEAR 1988.
Geological Survey, Boston, MA. Water Resources Div.
R. A. Gadoury, R. S. Socolow, R. W. Bell, and T. J. Calderini.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-266297/AS. Price codes: A11 in paper copy; A02 in microfiche. Water-Data Report MA-88-1 (USGS/WRD/HD-90/245), 1990. 231p. Prepared in cooperation with the States of Massachusetts and Rhode Island and with other agencies.

Descriptors: *Data collections, *Groundwater, *Hydrologic data, *Massachusetts, *Rhode Island, *Surface water, *Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Water analysis, Water temperature.

Water resources data for the 1988 water year for Massachusetts and Rhode Island consist of stage, discharge and water quality of streams; contents of lakes and reservoirs; and groundwater levels. This report contains discharge records for 94 gaging stations, monthend contents for 20 lakes and reservoirs, water quality for 9 gaging stations and water levels for 108 observation wells. Also included are data for one crest-stage partial-record station. Additional water data were collected at various sites, not part of the systematic data-collection program and are published as miscellaneous measurements.

A few pertinent stations in bordering states are also ncluded in this report. These data represent that portion of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Massachusetts and Rhode Island. (USGS)
W91-02629

WATER RESOURCES DATA FOR MISSOURI, WATER YEAR 1989.
Geological Survey, Rolla, MO. Water Resources Div.
L. A. Waite, J. V. Davis, H. L. Reed, D. O. Hatten, and T. J. Perkins.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-262601. Price codes: A16 in paper copy, A02 in microfiche. Water-Data Report MO-89-1 (USGS/WRD/HD-90/300), 1990. 353p. Prepared in cooperation with the State of Missouri and other agencies.

Descriptors: *Data collections, *Groundwater, *Hydrologic data, *Missouri, *Surface water, Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Sites, Water analysis, Water temperature.

The U.S. Geological Survey, Water Resources Division, in cooperation with local, State, and Federal agencies and organizations, obtains a large quantity of data pertaining to the water resources of Missouri each water year. These data, accumulated during many water years, constitute a valuable data base for developing an improved understanding of the water resources of Missouri. Water resources data for the 1989 water year for Missouri consist of records of stage, discharge and water quality of lakes and reservoirs. This report contains records for water discharge at 109 gaging stations; stage and contents at 11 lakes and reservoirs; water level records for 49 groundwater monitoring wells; water quality at 52 surface water sampling stations (including 2 lakes); and data for 19 crest-stage stations. (USGS)
W91-02630

WATER RESOURCES DATA FOR MONTANA, WATER YEAR 1989.
Geological Survey, Helena, MT. Water Resources Div.
R. R. Shields, J. R. Knapton, M. K. White, T. M. Crosten, and J. H. Lambing.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-252362. Price codes: A25 in paper copy. A04 in microfiche. Water-Data Report MT-89-1 (USGS/WRD/HD-90/253), 1990. 562p. Prepared in cooperation with the State of Montana and with other agencies.

Descriptors: *Data collections, *Groundwater, *Hydrologic data, *Montana, *Surface water, Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Water analysis, Water temperature.

Water resources data for water year 1989 for Montana consist of records of stage, discharge, and water quality of streams; stage, contents and water quality of lakes and reservoirs; and water levels in wells. This report contains discharge records for 6 gaging stations; stage/contents for 9 lakes and reservoirs; water quality for 109 stations, 3 lakes; water levels for 276 observation wells and 8 long-term observation wells equipped with continuous recorders. Also included are 53 smaller reservoirs. Additional water year 1989 data collected at crest-stage gage and miscellaneous measurement sites were collected but are not published in this report. These data are stored within the district office files in Helena and are available on request. These data represent part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Montana. (USGS)
W91-02631

WATER RESOURCES DATA FOR NEW JERSEY, WATER YEAR 1989, VOLUME 1: ATLANTIC SLOPE BASINS, HUDSON RIVER TO CAPE MAY.
Geological Survey, West Trenton, NJ. Water Resources Div.
W. R. Bauersfeld, E. W. Moshinsky, E. A. Pustay, and W. D. Jones.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-252347. Price codes: A16 in paper copy. A02 in microfiche. Water-Data Report NJ-89-1 (USGS/WRD/HD-90/289), 1990. 345p. Prepared in cooperation with the New Jersey Department of Environmental Protection and with other agencies.

Descriptors: *Data collections, *Groundwater, *Hydrologic data, *New Jersey, *Surface water, *Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Water analysis, Water temperature.

Water resources data for water year 1989 for New Jersey consist of records of stage, discharge, and water quality of streams; stage, contents and water quality of lakes and reservoirs; and water levels and water quality of groundwater. This volume of the report contains discharge records for 73 gaging stations; tide summaries for 1 station; stage and contents for 15 lakes and reservoirs; water quality for 61 surface-water sites and 116 wells; and water levels for 69 observation wells. Also included are data for 39 crest-stage partial record stations, 11 tidal crest-stage gages, and 58 low flow partial record stations. Additional water data were collected at 54 sites, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in New Jersey. (See also W90-06440 and W91-02633) (USGS)
W91-02632

WATER RESOURCES DATA FOR NEW JERSEY, WATER YEAR 1989, VOLUME 2: DELAWARE RIVER BASIN AND TRIBUTARIES TO DELAWARE BAY.
Geological Survey, West Trenton, NJ. Water Resources Div.
W. R. Bauersfeld, E. W. Moshinsky, E. A. Pustay, and W. D. Jones.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-252370. Price codes: A11 in paper copy; A02 in microfiche. Water-Data Report NJ-89-2 (USGS/WRD/HD-90/290), 1990. 215p. Prepared in cooperation with the New Jersey Department of Environmental Protection and with other agencies.

Descriptors: *Data collections, *Groundwater, *Hydrologic data, *New Jersey, *Surface water, *Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Water analysis, Water temperature.

Water resources data for water year 1989 for New Jersey consist of records of stage, discharge, and water quality of streams; stage, contents and water quality of lakes and reservoirs; and water levels and water quality of groundwater. This volume of the report contains discharge records for 24 gaging stations; tide summaries for 3 stations; stage and contents for 18 lakes and reservoirs; water quality for 30 surface-water sites and 50 wells; and water levels for 55 observation wells. Also included are data for 23 crest-stage partial record stations, 2 tidal crest-stage gages, and 18 low-flow partial-record stations. Additional water data were collected at 10 sites, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in New Jersey. (See W90-06441 and W91-02632) (USGS)
W91-02633

WATER RESOURCES DATA FOR NEW YORK, WATER YEAR 1989, VOLUME 2: LONG ISLAND.
Geological Survey, Syosset, NY. Water Resources Div.
A. G. Spinello, J. H. Nakao, R. Busciolano, R. B. Winowitch, and V. K. Eagen.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-262619. Price codes: A10 in paper copy, A02 in microfiche. Water-Data Report NY-89-2 (USGS/WRD/HD-90/296), 1990. 196p. Prepared in cooperation with the State of New York and other agencies.

Descriptors: *Data collections, *Groundwater, *Hydrologic data, *New York, *Surface water, *Water quality, Chemical analysis, Flow rates, Gaging stations, Sampling sites, Sediments, Sites, Water analysis, Water temperature.

Water resources data for water year 1989 for New York consist of records of stage, discharge, and water quality of streams; stage, contents and water quality of lakes and reservoirs; and water levels and water quality of groundwater wells. This volume contains discharge records for 17 gaging stations; water quality at 17 gaging stations, and 7 wells; and water levels at 225 observation wells. Also included are data for 74 low-flow partial-record stations. Additional water data were collected at various sites not involved in the systematic data collection program, and are published as miscellaneous measurements and analyses. These data, together with the data in Volumes 1 and 3 represent that part of the National Water Data System operated by the U.S. Geological Survey in cooperation with State, Federal and other agencies in New York. (USGS)
W91-02634

WATER RESOURCES DATA FOR PENNSYLVANIA, WATER YEAR 1989. VOLUME 2: SUSQUEHANNA AND POTOMAC RIVER BASINS.
Geological Survey, Harrisburg, PA. Water Resources Div.
W. C. Loper, T. E. Behrendt, and W. P. Schaffstall.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-252271/AS. Price codes: A13 in paper copy; A02 in microfiche. Water-Data Report PA-89-2 (USGS/WRD/HD-90/283), 1990. 289p. Prepared in cooperation with the State of Pennsylvania and other agencies.

Descriptors: *Data collections, *Groundwater, *Hydrologic data, *Pennsylvania, *Surface water, *Water quality, Chemical analysis, Data collection sites, Flow rates, Gaging stations, Lakes, Reservoirs, Sediments, Streamflow, Water analysis, Water temperature.

Water resources data for water year 1989 for Pennsylvania consist of records of discharge and water quality of streams; contents and elevations of lakes and reservoirs; and water levels and water quality of groundwater wells. This report, Volume 2, includes records from the Susquehanna and Potomac River basins. Specifically, it contains: (1) discharge records for 90 continuous-record streamflow-gaging stations and 108 partial-record stations; (2) elevation and contents records for 13 lakes and reservoirs; (3) water quality records for 17 streamflow-gaging stations, for 10 ungaged streamsites, and for 14 wells or springs; and (4) water level records for 39 observation wells. Location of these sites are shown. Additional water data were collected at various sites not involved in the systematic data collection program and are published as miscellaneous measurements and analyses and represent 20 special study and miscellaneous streamflow sites. These data together with the data in Volumes 1 and 3 represent that part of the National Water Data System operated by the U.S. Geological Survey in cooperation with State, Federal and other agencies in Pennsylvania. (USGS)
W91-02635

WATER RESOURCES DATA FOR PUERTO RICO AND THE U.S. VIRGIN ISLANDS, WATER YEAR 1989.
Geological Survey, San Juan, PR. Water Resources Div.
R. E. Curtis, Z. Aquino, R. J. Vachier, and P. L. Diaz.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-258880. Price coes: A18 in paper copy, A03 in microfiche.

Water-Data Report PR-89-1 (USGS/WRD/HD-90/242), 1990. 420p. Prepared in cooperation with the State of Puerto Rico, the Government of the U.S. Virgin Islands and other agencies.

Descriptors: *Data collections, *Groundwater, *Hydrologic data, *Puerto Rico, *Surface water, *Virgin Islands (US), *Water quality, Aquifers, Chemical analysis, Flow rates, Gaging stations, Lakes, Sediments, Streamflow, Water analysis, Water level.

Water resources data for surface water, quality of water, groundwater records for the 1989 water year for Puerto Rico and the U.S. Virgin Islands, consist of records of discharge, water quality of streams, and water levels of wells. This report contains discharge records for 60 streamflow-gaging stations; 91 partial-record or miscellaneous streamflow stations; stage records for 7 reservoirs; 1 crest-stage, partial-record streamflow station; water quality records for 16 streamflow-gaging stations, 42 ungaged streamsites, 11 lake sites, 2 lagoons, and 1 bay; and water level records for 76 observation wells. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating local and federal agencies in Puerto Rico and the U.S. Virgin Islands. (USGS)
W91-02636

WATER RESOURCES DATA FOR SOUTH CAROLINA, WATER YEAR 1989.
Geological Survey, Columbia, SC. Water Resources Div.
C. S. Bennett, T. W. Cooney, K. H. Jones, B. W. Church, and G. L. Murray.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-262304. Price codes, A25 in paper copy, A04 in microfiche. Water-Data Report SC-89-1 (USGS/WRD/HD-90/263), 1989. 585p. Prepared in cooperation with the State of South Carolina and with other agencies.

Descriptors: *Data collections, *Groundwater, *Hydrologic data, *South Carolina, *Surface water, *Water quality, Aquifers, Chemical analysis, Flow rates, Gaging stations, Lakes, Sediments, Streamflow, Water analysis, Water level.

Water resources data for the 1989 water year for South Carolina consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and levels of groundwater wells. This volume contains records for water discharge at 116 gaging stations, stage only at 23 gaging stations, stage and contents at 12 lakes and reservoirs, water quality at 61 gaging stations, and water levels at 56 observation wells. Also included are data for 41 crest-stage partial-record stations and discharge measurement information at 4 locations. Locations of these sites are shown. Additional water data were collected at various sites not involved in the systematic data collection program. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in South Carolina. (USGS)
W91-02637

WATER RESOURCES DATA FOR SOUTH DAKOTA, WATER YEAR 1989.
Geological Survey, Huron, SD. Water Resources Div.
M. J. Burr, R. D. Benson, and D. S. Hansen.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-262593. Price codes: A17 in paper copy, A03 in microfiche. Water-Data Report SD-89-1 (USGS/WRD/HD-90/294), 1990. 383p. Prepared in cooperation with the State of South Dakota and with other agencies.

Descriptors: *Data collections, *Groundwater, *Hydrologic data, *South Carolina, *Surface water, *Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Reservoirs, Sampling sites, Sediments, Streamflow, Water analysis, Water level, Water temperature.

Water resources data for the 1989 water year for South Dakota consist of records of stage, discharge, and water quality of streams; stage, contents and water quality of lakes and reservoirs; and water levels in wells. This report contains discharge records for 147 streamflow-gaging stations; stage and contents records for 10 lakes and reservoirs, stage for 7 streams and 4 lakes; water quality records for 16 streamflow-gaging stations, 3 daily-sediment stations, 3 wells, 6 ungaged streamsites, 1 lake, 1 sewage lagoon, and 1 precipitation site; water levels for 30 wells; daily precipitation records at 38 sites; and 9 partial-record crest-stage gage sites. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements and analyses. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in South Dakota. (USGS)
W91-02638

WATER RESOURCES DATA FOR TEXAS, WATER YEAR 1989. VOLUME 2: SAN JACINTO RIVER, BRAZOS RIVER, SAN BERNARD RIVER BASINS AND INTERVENING COASTAL BASINS.
Geological Survey, Austin, TX. Water Resources Div.
H. D. Buckner, W. J. Shelby, and H. J. Davidson.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-268574/AS. Price codes: A18 in paper copy; A03 in microfiche. Water-Data Report TX-89-2 (USGS/WRD/HD-90/292), 1990. 412p. Prepared in cooperation with the State of Texas and with other agencies.

Descriptors: *Data collections, *Hydrologic data, *Surface water, *Texas, *Water quality, Chemical analysis, Flow rates, Gaging stations, Lakes, Sampling sites, Sediments, Streamflow, Water analysis, Water level.

Water resources data for the 1989 water year for Texas are presented in three volumes, appropriately identified as to content by river basins. Data in each volume consist of records of stage, discharge, and water quality of streams and canals; and stage, contents, and water quality of lakes and reservoirs. Also included are crest-stage and flood-hydrograph partial-record stations, reconnaissance partial-record stations, and low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. Records for a few pertinent stations in bordering States also are included. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Texas. (See also W91-02640) (USGS)
W91-02639

WATER RESOURCES DATA FOR TEXAS, WATER YEAR 1989. VOLUME 3: COLORADO RIVER, LAVACA RIVER, GUADALUPE RIVER, NUECES RIVER, RIO GRANDE BASINS AND INTERVENING COASTAL BASINS.
Geological Survey, Austin, TX. Water Resources Div.
H. D. Buckner, W. J. Shelby, and H. J. Davidson.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-268582/AS. Price codes: A19 in paper copy; A03 in microfiche. Water-Data Report TX-89-3 (USGS/WRD/HD-90/293), 1990. 425p. Prepared in cooperation with the State of Texas and with other agencies.

Descriptors: *Data collections, *Flow rates, *Hydrologic data, *Surface water, *Texas, *Water quality, Chemical analysis, Gaging stations, Lakes, Sampling sites, Sediments, Streamflow, Water analysis, Water level.

Water resources data for the 1989 water year for Texas are presented in three volumes, appropriately identified as to content by river basins. Data in each volume consist of records of stage, discharge, and water quality of streams and canals; and stage, contents, and water quality of lakes and reservoirs. Also included are crest-stage and flood-hydrograph partial-record stations, reconnaissance partial-record stations, and low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. Records for a few pertinent stations in bordering States also are included. W91-02640

WATER RESOURCES DATA FOR WASHINGTON, WATER YEAR 1989.
Geological Survey, Tacoma, WA. Water Resources Div.
M. B. Miles, W. D. Wiggins, G. P. Ruppert, R. L. Blazs, and L. L. Reed.
Available from National Technical Information Service, Springfield, VA 22161 as PB90-252354. Price codes: A21 in paper copy, A03 in microfiche. Water-Data Report WA-89-1 (USGS/WRD/HD-90/285), 1990. 467p. Prepared in cooperation with the State of Utah and with other agencies.

*Utah, *Hydrologic data, *Data collections, *Surface water, *Groundwater, *Water quality, Streamflow, Lakes, Gaging stations, Chemical analysis, Sediments, Water analysis, Water levels, Flow rates, Sampling sites.

Water resources data for the 1989 water year for Washington consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels of wells. The report contains discharge records for 203 gaging stations; stage only records for 5 gaging stations; and stage and (or) contents for 35 lakes reservoirs; water quality for 33 streamflow-gaging stations, and 7 ungaged streamsites; water levels for 77 observation wells; and water quality for 1 observation well. Also included are data for 5 crest-stage partial-record stations and 110 partial-record or miscellaneious streamflow stations. Locations of these sites are shown. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Washington. (USGS)

Z. W. Kundzewicz, J. Ihringer, E. J. Plate, and J. Grimm-Strele.
IN: Groundwater Management: Quantity and Quality. Proceedings of the Symposium held at Benidorm, Spain, October 2-9, 1989. International Association of Hydrological Sciences, Washington, DC. 1989. p 161-169, 3 fig, 8 ref.

Descriptors: *Data interpretation, *Error analysis, *Groundwater quality, *Statistics, *Time series analysis, Databases, Forecasting, Groundwater data, Groundwater management, Hydrologic data collections, Water quality management, Water resources management.

The amount of groundwater quality data collected repetitively in several locations and pertaining to some dozens of parameters is very high. Therefore, in order to screen the data, a plausibility analysis of an incoming data point should be made before the point in question is accommodated into the data base. The problem of the detection of outliers in time series of non-equidistant groundwater quality data has been addressed. The operational check of data consistency, i.e., the procedure of judging if the newly acquired data element fits the temporal structure of the remainder of the data set, was used. This includes issuing the forecast of the variable in question, assessment of the variance of the forecast error, and checking if the newly incoming data point does not substantially depart from the forecast value. The methodology used is based on a modified exponential smoothing method which, in the problem considered, was more feasible than Kalman filtering and the geostatistics of temporal fields. Plausibility analysis of groundwater quality data is an important step in the building of databases necessary for decision making on water resources. (See also W91-02672) (Author's abstract)

SENSITIVITY OF THE SURFACE HYDROLOGY TO THE COMPLEXITY OF THE LAND-SURFACE PARAMETERIZATION SCHEME EMPLOYED.
Macquarie Univ., North Ryde (Australia). School of Earth Sciences.
A. Henderson-Sellers, A. J. Pitman, and R. E. Dickinson.
Atmosfera ATMSEF, Vol. 3, No. 3, p 183-201, July 1990. 10 fig, 30 ref.

Descriptors: *Atmospheric circulation, *Climatology, *Data interpretation, *Hydrologic models, *Model studies, *Parametric hydrology, Carbon dioxide, Climatic changes, Diurnal variation, Hydrologic cycle, Precipitation, Solar radiation.

The sensitivity of surface hydrology to the parameterization scheme incorporated in three different atmospheric general circulation models (AGCMs) was investigated. It was found that the simulations of the surface hydrology by the NCAR Community Climate Model (CCM0) and GFDL models (which incorporate the bucket-type hydrological parameterization) differ markedly from the CCMiB model (which incorporates the Biosphere Atmosphere Transfer Scheme, BATS). The AGCMs which incorporate the simpler parameterizations of the land surface simulate a number of physical phenomena unrealistically. Many of these gross problems in the land surface climatology are eliminated in the CCM1B model which incorporates BATS. When present-day and doubled CO2 scenarios were compared, the differences between model results incorporating different surface schemes were greater than the differences between 1 x and 2 x CO2. The implications of these results are that the surface hydrological fields from AGCMs, and their predictions of climatic change at the land surface, are likely to be unreliable. Investigations of the impact of climatic change consequent upon changes in the land surface climatology should employ one of the advanced parameterizations of the land surface coupled into the general circulation model, and develop and validate those components of the atmospheric model, such as the surface radiative forcing, regional precipitation patterns, and the diurnal cycle within the planetary boundary layer, that are most important for deriving land surface processes. Distinguishing different scales of variability in hydrologic properties such as hydraulic conductivity is often useful. In the simplest two-scale case, large-scale variations can be viewed as a trend, while small-scale fluctuations about this trend can be viewed as a random residual. This paper describes a method for estimating spatial trends from scattered field measurements. The basic concept is to treat both the trend and the residual as stationary random functions. these functions are distinguished by their spatial spectral (or covariance) properties, which may be estimated from available data or hypothesized. Two versions exist of a general algorithm for estimating spatial trends: (1) a discrete version which is useful in practical applications where data are limited and irregularly spaced and (2) a continuous version which can be used to study the effects of using incorrect spectral parameters. Applications of the discrete algorithm to both synthetically generated data and field measurements yield satisfactory trend estimates. An analysis based on the continuous algorithm shows that the estimation error lower bound for these applications depends on two dimensionless ratios, that is, the scale disparity (ratio of the trend and residual correlation scales) and the signal-to-noise ratio (ratio of the trend and residual variances). These ratios may be used to evaluate the feasibility of trend estimation before field samples are actually collected. Multiscale approaches to modeling and data collection can provide a practical and very flexible way to deal with natural variability. (Author's abstract)

Water Resources Research WRERAQ, Vol. 26, No. 10, p 2507-2525, October 1990. 3 fig, 11 ref, 54 ref, 3 append. National Science Foundation Grant No. 8814888.

Descriptors: *Groundwater, *Groundwater movement, *Hydrological models, *Mathematical models, *Parameter estimation, *Sensitivity analysis, Experimental design, Hydraulic conductivity, Optimization, Parameterization, Solutes.

Because there are crossover effects between state variables and parameters, coupled inverse problems are different from single inverse problems in several aspects, especially in the selection of objective functions, identifiability, and experimental design. Parameter identification of coupled problems in groundwater modeling is defined as a vector optimization problem which can be solved by the weighting method. In order to obtain gradient vectors of objective functions as well as all sensitivity coefficients, the adjoint state method is extended to the case of coupled problems. Using derived rules, the adjoint equations of any nonlinear and transient coupled problem can be obtained. Sensitivity analyses based on the adjoint method are powerful tools for designing a reasonable experiment for solving the coupled inverse problem. The fact that hydraulic conductivities can be identified through the observation of solute concentration shows the possibility of using crossover effects in the solution of coupled inverse problems. Water Resources Research WRERAQ, Vol. 26, No. 10, p 2527-2540, October 1990. 9 fig, 10 tab, 25 ref, append. National Science Foundation Grant No. CES 8814888.

Descriptors: *Experimental design, *Groundwater models, *Groundwater movement, *Hydrologic models, *Mathematical models, Estimating, Parameterization, Parameters, Resource management.

Three new definitions of extended identifiability for a distributed parameter system are presented: interval identifiability, prediction equivalence identifiability, and management equivalence identifiability. The uniqueness requirement of the inverse solution is relaxed by these definitions. An identified parameter is considered extendedly identifiable if it is able to satisfy an accuracy requirement in a specific application of the model. When a generalized least squares norm is used, the proposed identifiabilities are applicable to any coupled problems in which the state variables and parameters may have different order of magnitudes. A salient feature of the new definitions is that the extended identifiabilities are closely related to experimental design. Consequently, the sufficiency of an experimental design for assuring a given level of an extended identifiability can be estimated prior to field experiments. The methodology developed, linking experimental design, parameter identification, and management decisions can be used to determine the reliability of an experimental design even for nonlinear models. The 184 m-high Ataturk rockfill dam is now almost complete. Impounding began in January 1990 and the first 300 megaWatt (MW) unit of the powerplant will go into operation in 1991. The last of the eight units is expected to begin operation before the end of 1993. The drainage area of the Euphrates at the Ataturk dam site is 92,338 sq km and the mean flow is estimated to be in the order of 830 cu m/s. The diversion of the Euphrates River during construction of the dam was accomplished by upstream and downstream cofferdams and three tunnels through the left bank. An overflow spillway of 16,800 cu m/s capacity has been constructed. The embankment volume of 84.5 million cu m and reservoir volume of 48.5 cu km make Ataturk the largest dam in Turkey. The rockfill dam has a central clay core and a height of 184 m. The unit capacity is 300 MW; the scheme's total capacity of 2400 MW and energy generation of 8.9 TWh/year make it the largest hydroelectric plant in Turkey. (MacKeen-PTT)

Sir dam, Turkey's third double curvature arch dam, is almost completed. The drainage area of the Ceyan River at the dam site is 12,950 sq km and the mean flow is estimated to be 130 cu m/s. The reservoir has a gross storage of 1.12 cu km and an active storage of 0.72 cu m. Diversion during construction was accomplished by the upstream and downstream cofferdams and a tunnel through the left bank. An overflow spillway has a capacity of 7460 cu m/s. The 120-m high double curvature concrete arch dam has a crest length of 325 m and a thickness of 5 m at the crest, 17.5 m at the foundation, and up to 25 m at the abutments. There are three intakes in the dam body, each serving a separate 66-m long penstock. The 55-m high powerhouse is designed for three 96.5 megaWatt units with an annual average generation capacity of 725 GWh/year. Impoundment began on 31 May 1990, and the first unit is expected to begin operation early in 1991. (MacKeen-PTT)

ADVANTAGES OF TURNKEY CONTRACTS IN HYDRO DEVELOPMENT.
P. Johannesson.
International Water Power and Dam Construction IWPCDM, Vol. 42, No. 9, p 29-30, 32, 35-38, September 1990. 14 fig, 10 tab, 4 ref.

Descriptors: *Contracts, *Cost analysis, *Dam construction, *Dams, *Hydroelectric plants, *Water resources development, California, Construction costs, Costs, Hydroelectric power, North Fork Stanislaus River Hydroelectric, Optimum development plans, Project planning, Sierra Nevada Mountains, Turnkey operations.

The Calaveras project, known formally as the North Fork Stanislaus River Hydroelectric Development Project, is in the Sierra Nevada Mountains, about 320 km east of San Francisco. It is a complex project involving seven tunnels (18 km total length), a 790 m shaft, two concrete gravity dams, one concrete-faced rockfill dam, one double curvature thin arch dam and two powerhouses. It was developed as a turnkey arrangement with Sierra Constructors as the contractor. Challenges at the bidding stage of the project included: increased concrete volume required at North Fork diversion dam; unfavorable rock foundation profile at saddle dam site; discovery of faults at saddle and main dam sites; lack of exploration at Beaver Creek dam, tunnel and penstock area; foundation problems at McKay's dam site; and problems drilling the Collierville shaft. It took the owner 20 years and about $16 million to obtain the FERC license, purchase the right-of-way, settle mitigation issues with Fish and Game and school recreational groups, and pay for legal services, engineering and environmental studies. The most unusual aspect of this turnkey project was the bidding phase, accomplished in only 6 mo. Construction time was fixed at 5 yr. A 2.5 yr time savings was realized, compared with estimates for conventional project development. Compared with conventional development costs, savings for turnkey development of Calaveras were $23.5 million in interest payments, $16.5 million for 2.5 yr early commissioning, and $89.2 million in construction costs. The total savings was about $120 million. (MacKeen-PTT)

national Water Resources Association, Urbana, Illinois. 1990. p 233-241, 3 fig, 1 ref.

Descriptors: *Arid lands, *Botswana, *Reservoir capacity, *Reservoir design, *Semiarid lands, *Streamflow forecasting, Design criteria, Gabarone Reservoir, Gould matrix method, Probability, Reservoir storage, Reservoir yield, Simulation.

Many methods are available for reservoir storage-yield design, but they rely on long inflow sequences that are often scarce in arid and semi-arid regions. The Gould matrix method provides a technique that defines probability of failure and spill under specified withdrawal policies. The method does have some limitations, but it can provide much more sophisticated information that other commonly used techniques. In the case of the Gabarone (Botswana) reservoir, results employing the Gould matrix method show that if the reservoir is currently in a low zone at the start of the year, the likelihood of failure in the first few years is very high. As the initial reservoir water level increases, the short-term likelihood of failure is reduced. If the reservoir is at least half full, the probability of failure in the next few years progresses from zero to nearly 5%. It is possible to introduce rationing into the Gould procedure as part of the water balance. The results of five simulations based on an example from Great Britain show a decreasing yield as the probability of rationing increases with increase in return period of total failure. The same approach can be used to investigate the relationship between the return period of total failure with and without rationing, but with the same yield. (See also W91-02288) (Rochester-PTT)

HYDROLOGIC DESIGN AND DEVELOPMENT OF HYDRAULIC STRUCTURES.
Dar es Salaam Univ. (Tanzania).
J. I. Matondo, and D. G. Fontane.
IN: The State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa. Proceedings of the Sahel Forum, Ouagadougou, Burkina Faso, 18-23 February 1989. International Water Resources Association, Urbana, Illinois. 1990. p 306-319, 6 fig.

Descriptors: *Africa, *Dam design, *Design criteria, *Hydraulic engineering, *Semiarid lands, *Storage reservoirs, *Water storage, Arid lands, Data collections, Developing countries, Hydraulic design, Sediment control, Sensitivity analysis, Simulation, Water resources management.

In semi-arid areas the design of adequate water storage structures and distribution systems (i.e., small earth dams) is essential to deal with present and future water resources problems. Hydrologic data are lacking in most developing countries in the arid and semi-arid regions of Africa. Techniques used in the design of hydraulic structures when data are inadequate include sensitivity analysis with design simulation models, transfer of existing data from other locations, and synthetic generation of data based on watershed characteristics. Because sediment trapped in reservoirs ultimately reduces their effectiveness, sediment control measures must be included in the design of dams and water diversion structures. Various sediment exclusion and ejection techniques exist (e.g., settling basins, guide walls and channel curvature, vortex tube, guide vanes, tunnel excluders, combination sluice tunnel-settling basin excluder, combined weeving weir and silt ejector, and combined tunnel-sluice vane ejector). Because economic difficulties exist in most countries in Africa, water resources projects must be planned and developed according to projected water needs. Techniques for optimal scheduling of projects have been developed. There is no substitute for collection of hydrology data. (See also W91-02288) (Author's abstract)

Descriptors: *Africa, *Arid lands, *Dam design, *Interflux dams, *Sahara, *Sahel, Alluvial fans, Climates, Design criteria, Developing countries, Groundwater recharge, Rural areas, Water resources development.

Interflux dams and several related topics are discussed. First, the principle of subsurface dams and their advantages for improving water resources and quality are described. Mechanisms of the deposition and the preservation of alluvial fan deposits are discussed for both exorheic and endorheic basins. Climate variation and glacio-eustatic phenomena dominated these processes over the past 20,000 yr. Underflow and its exploitation in arid regions are discussed and examples analyzed from the Sahel, northern Africa, East Africa, and southern Africa. It is concluded that numerous small dams can be constructed in the Saharan and Sahelian regions that will allow both the accumulation of underground reserves and their recharge. Increasing such dams would help to maintain rural settlement. (See also W91-02288) (Author's abstract)

SLIPLINING RESCUES SEWERS AND A SMALL BUDGET.
L. C. Green, and J. Douglas.
Public Works PUWOAH, Vol. 121, No. 10, p 104-105, September 1990. 1 fig.

Descriptors: *Conveyance structures, *Economic aspects, *Pipes, *Rehabilitation, *Sewer systems, Cost analysis, Costs, Pipelines, Sewers, South Carolina, Water conveyance.

Winnsboro, South Carolina sewer system serves 4,000 customers in the town, plus an additional 8,000 customers in surrounding Fairfield County. The sewer system, originally installed in the early 1930s, was showing signs of aging. The major problem was tree roots forcing their way into joints and cracks, causing more cracks, allowing excessive sand and stormwater to seep into the system. Trenchless sewer rehabilitation technology involving insertion lining of the sewers, also called sliplining, allowed the town to repair its sewer system on a very limited budget. Sliplining increased the sewer strength because liners withstand temperatures up to 250 F, most chemicals and acids, and cannot be penetrated by roots. A service life of 50-100 years and low maintenance due to smooth plastic walls which require less cleaning, routing, and other work will provide long-term financial savings. Few traffic disruptions were necessary during installation because the sliplining used lines already in place. To date, the project saved the town more than $300,000 over pipe replacement costs. The biggest savings will be time saved that would otherwise have been used to maintain and service the old system. (Mertz-PTT)

Descriptors: *Embankments, *Flow profiles, *Model studies, *Overtopping, Banks, Clays, Dam failure, Data acquisition, Earth dams, Erosion, Hydrologic models, Performance evaluation, Photography.

Overtopping of earth dams and embankments has resulted in great damage to property and facilities, and in some cases loss of life as well. Due to the large costs and possible consequences of full-scale overtopping studies and the limited accuracy of reduced scale model testing at natural gravity levels, testing of models in a centrifuge at increased gravity levels seems to be a suitable method for studying overtopping and erosion of earth embankments. Tests on model earth and crushed rock embankments using the University of Colorado Geotechnical Centrifuge have indicated the feasibility of this method of testing. Failure modes in the models agreed well with those observed in actual overtopping events. In crushed rock embankment erosion began at the toe and progressed rapidly upstream, eventually leading to breaching failure of embankments. In clay embankments, erosion occurred over the entire downslope area below the spillway crest, with no breaching of the crest occurring for the duration of overtopping flow utilized in the tests. Embankment erosion in flight was recorded using a closed circuit video camera and video tape and a pair of 35 mm SLR cameras, mounted to produce stereo pair photos of the embankment. Contour maps of the embankment surface were produced from the stereo pairs. Photographic records were verified by manual measurements of the eroded surface. K. Y. Lo, and K. Kaniaru.
Canadian Geotechnical Journal CGJOAH, Vol. 27, No. 4, p 496-506, August 1990. 13 fig, 1 tab, 20 ref. Natural Sciences and Engineering Research Council of Canada Grant No. OGP0007745.

Descriptors: *Dam failure, *Dam foundations, *Hydraulic fracturing, *Mathematical models, *Model studies, *Seepage, Consolidation, Saturation, Soil strength.

Unsatisfactory performance of earth and rock-fill dams involving excessive seepage, piping or failure has been attributed to hydrofracture of the core. Although the phenomenon has been reported for some time, important factors influencing hydraulic fracturing pressure, such as saturation and consolidation, have received relatively little attention; nor have results of laboratory tests or theoretical study been directly related to field performance. A laboratory testing program was made to determine the hydraulic fracturing pressure on compacted soil samples with grain-size distributions similar to those of the core materials used in construction of the dams in the case records. A simple theoretical expression for fracture pressure was developed involving only conventional soil strength parameters. The results showed that hydraulic fracture pressure is not a unique soil property; its value depends on the degree of saturation and consolidation. A comparison of the data deduced from case records with test results and theoretical predictions indicates general consistency. The field hydraulic fracturing pressures are bounded in the upper limit by results from saturated-consolidated tests and in the lower limit by results of saturated-unconsolidated hydraulic fracturing tests. The methodology presented may be useful in the assessment of risk of hydraulic fracturing of dams. (Author's abstract)

B. W. Karney.
Journal of Hydraulic Engineering (ASCE) JHEND8, Vol. 116, No. 10, p 1180-1196, October 1990. 6 fig, 11 ref.

Descriptors: *Closed-conduit flow, *Energy conversion, *Flow rates, *Hydraulic properties, *Pipe flow, *Pipelines, *Unsteady flow, Compressibility, Elasticity, Energy, Flow models, Friction, Kinetic energy, Mathematical analysis, Mathematical equations.

When the rate of flow in a closed conduit is changed, large scale conversions of mechanical energy often occur, particularly if the pipeline is carrying water or some other slightly compressible liquid. Mathematical expressions describing these transient energy transformations are motivated from first principles and derived by mathematical manipulation of the governing continuity and momentum equations. The resulting expression accounts for the kinetic energy of the fluid, the internal energy associated with fluid compressibility and pipeline elasticity effects, the energy dissipated by friction, and the work done at the ends of the conduit. The energy approach provides an integrated view of transient conditions in the pipeline and is thus a simple, efficient, and logically consistent way of comparing the transient response of different systems and solution techniques. In particular, compressibility effects are shown to be negligible when the ratio of the change in internal energy to the change in kinetic energy is much less than one. This rule helps to distinguish the 'rigid water column' model of unsteady flow from the more complex water-hammer theory. (Author's abstract)

NEW MADRID PUMPING STATION GRAVITY FLOW CONDUIT AND CONFLUENCE, NEW MADRID FLOODWAY, MISSOURI: HYDRAULIC MODEL INVESTIGATION.
Army Engineer Waterways Experiment Station, Vicksburg, MS. Hydraulics Lab.
J. R. Leech.
Available from the National Technical Information Service, Springfield, VA 22161. Technical Report No. HL-90-12, September 1990. 112 p, 9 fig, 72 plates, 15 photos.

Descriptors: *Conduits, *Gravity flow, *Hydraulic models, *New Madrid Pumping Station, Channel flow, Channels, Hydraulic structures, Missouri, Pumping plants.

Site-specific hydraulic model studies of hydraulic structures and channels on the New Madrid Floodway, Missouri, were conducted to give three dimensional analyses of the open channels, to provide design information, and to minimize prototype cost. The proposed pumping station on the New Madrid Floodway consisted of a draft tube-type sump design, referred to as a formed suction inlet (FSI). The FSI has an advantage over conventional rectangular sumps by having a constantly decreasing cross-sectional area, which causes the flow to accelerate, eliminating vortices caused by geometry. A satisfactory FSI was developed by adding a cone section to the throat, which improved the dimensionless velocity contours. The riprap protection was found to be stable except for the area adjacent to the opening of the gravity flow intake. A plan was developed to correct the instability by replacing the original drop structure in the model, located at the confluence of the two channels, by a rip-rap lined channel, which provided satisfactory performance for all conditions tested. (Author's abstract)

YAZOO BACKWATER PUMPING STATION SUMP, WEST-CENTRAL MISSISSIPPI: HYDRAULIC MODEL INVESTIGATION.
Army Engineer Waterways Experiment Station, Vicksburg, MS. Hydraulics Div.
B. P. Fletcher.
Available from the National Technical Information Service, Springfield, VA 22161. Technical Report No. HL-90-8, August 1990. 124 p, 9 fig, 2 tab, 83 plates, 2 photos.

Descriptors: *Hydraulic models, *Pumping plants, *Sumps, *Yazoo Backwater Pumping Station, Channel flow, Channels, Flow profiles, Hydraulic profiles, Hydraulic structures, Mississippi, Model studies, Vortices.

Numerical and physical hydraulic model tests were conducted to investigate the hydraulic performance of the Yazoo Backwater Pumping Station approach channel, sump abutments, and sump. The numerical model was used as a tool for evaluating and screening various approach channel designs prior to testing in the physical models. Physical model tests were conducted in a 1:12.5-scale section model and a 1:26-scale comprehensive model. A variety of operating conditions with various water surface elevations were evaluated. In the section model, tests indicated that the intensity of the floor vortices increased as the suction bell moved closer to the floor. Various configurations of approach training walls were evaluated in the section model. In the 1:26-scale model, comprehensive tests were initially conducted to investigate hydraulic performance in a 15-pump, 17,500-cfs-capacity pumping station. Asymmetrical pump operation generated lateral approaches in the approach channel, which generated an adverse flow distribution in the pump bays. Tests indicated that a streamlined pump intake design compensated for adverse flows in the approach. At the request of the US Army Engineer District, Vicksburg, the capacity of the pumping station was reduced from a 17,500 to a 10,000 cfs station. Tests were conducted to refine the design of the streamlined sump by investigating various pump bay widths. Test results indicated that the pump bay widths could be reduced from 28 to 23 ft if vortex suppressor beams were installed in the pump bays. The adopted design developed from the model study should provide satisfactory hydraulic performance for anticipated flow conditions. (Author's abstract)

STUDY OF EMBANKMENT PERFORMANCE DURING OVERTOPPING AND THROUGH-FLOW. REPORT 2: HYDRAULIC STUDY AND MODELING OF MODELS.
Colorado Univ., Boulder.
H. Y. Ko, J. Dunn, and E. Simantob.
Available from the National Technical Information Service, Springfield, VA 22161, as AD-A207756. Price codes: A04 in paper copy, A01 in microfiche. Miscellaneous Paper GL-89-5, April 1989. Report 2 of a Series. 65 p, 5 fig, 5 tab, 3 ref. DOA Contract DACW39-83-C-0011.

Descriptors: *Embankments, *Erosion, *Model studies, *Overtopping, Earth dams, Flow velocity, Hydraulic models, Performance evaluation.

An experimental program involving three rigid and three erodible model embankments is described. The rigid embankments are constructed of aluminum and are used to evaluate flow quantity, measure resulting water velocities, and perform a model study. Erodible embankment models were constructed of characteristic soils and were used to evaluate and document erosion in the scale models. The three scaling ratios used during this study were 1:24 scale, 1:49 scale, and 1:71 scale for both the rigid and erodible embankments. The system which delivered the overtopping water to the model is described along with other details of the centrifuge equipment, specimen preparation and testing techniques. A total of seven tests were performed during which erosion rates were documented and time scaling factors determined. This study confirmed that model behavior duplicated field behavior at least qualitatively in that erosion (as the result of overtopping) begins at the toe of the slope of an embankment then progresses upslope and through the crest as complete breach is observed. Available from the National Technical Information Service, Springfield, VA 22161, as AD-A207954. Price codes: A05 in paper copy, A01 in microfiche. Miscellaneous Paper GL-89-5, April 1989. Report 3 of a Series. 81 p, 39 fig, 3 ref, append. DOA Contract DACW39-83-C-0011.

Descriptors: *Embankments, *Erosion, *Model studies, *Overtopping, *Soil properties, Cohesive soils, Dam failure, Earth dams, Flow velocity, Hydraulic models, Performance evaluation.

An attempt was made to model two well documented embankment overtoppings: the Clarence Cannon and Bloomington Lake overtopping failures. The results of modeling in two dimensions versus modeling in three dimensions were investigated, along with a study of the effects of nonhomogeneous embankment cross sections on erosion. Centrifuge modeling of Clarence Cannon and Bloomington Lake overtopping events consisted of four tests each at 1:80 full scale. Materials used were fairly noncohesive and cohesive soils in an attempt to bracket prototype behavior rather than to duplicate a precise event. During testing, the centrifuge was repeatedly started and stopped in

order to take measurements of erosion resulting from overtopping. Agreement between scale models and documented prototype behavior was not especially good, but the study did confirm that noncohesive soils are considerably more erodible than cohesive materials in terms of their ability to withstand extended periods of overtopping without destruction. The attempt to evaluate the appropriateness of two-dimensional versus three-dimensional embankment modeling was inconclusive because of the interaction of the two dimensional models with the boundaries. The study did confirm that zoned embankment structures, once compromised, are much more erodible and susceptible to destruction than homogeneous structures. PLIT OF TWO-PHASE FLOW AT A HORI-ONTAL T-ANNULAR AND STRATIFIED LOW.
'KAEA Atomic Energy Research Establishment, arwell (England). Thermal Hydraulics Div.
. J. Azzopardi, D. Wagstaff, L. Patrick, S. B. lemory, and J. Dowling.
eport AERE R13059, May 1988. 56 p. 22 fig, 4 b, 22 ref.

escriptors: *Annular flow, *Hydraulic profiles, Pipe flow, *Stratified flow, Flow profiles, Hydraulics, Pressure, Split flow.

xperiments were carried out for wavy-stratified d annular flows approaching a horizontal T-nction, as well as flows at the boundary between ese two patterns. Data were obtained over an tire range of gas take-off pressures through the le arm. The effects of side arm diameter, system essure and gas momentum were studied system-cally, in addition to visualization experiments nich were carried out as the junction was viewed om several directions simultaneously. The data ere used to test some predictive methods. Study nclusions are that: (1) data on the flow split of nular and stratified flow by a horizontal junction ow regular and systematic trends; (2) the flow it depends strongly on the inertia (or momen-n) of the phases; and (3) the flow split is effected gas flow rate, liquid flow rate, gas density and ratio of the side arm to main tube diameter. antz-PTT)

EAD LOSSES IN STORM SEWER MAN-OLES: SUBMERGED JET THEORY.
chnical Univ. of Denmark, Lyngby. Inst. of drodynamics and Hydraulic Engineering.
B. Pedersen, and O. Mark.
rnal of Hydraulic Engineering (ASCE) ENDS, Vol. 116, No. 11, p 1317-1328, November 1990. 9 fig, 6 ref.

scriptors: *Head loss, *Hydraulic engineering, wer systems, *Storm sewers, *Submerged jets, , Manholes, Mathematical analysis, Pipes, Pres-e head.

e design of storm sewers especially suffers from k of knowledge of the head losses in manholes. ubmerged jet theory for the flow in manholes h straight throughflow has been developed. e entrance head loss is related to the kinetic rgy transformation associated with the entrain-t/detrainment in the jet. The exit head loss is culated as a Carnot-loss in connection with the a contracta in the exit pipe. The jet theory and eriments show that the only governing parame-for a specific manhole shape is the ratio of hole diameter to pipe diameter. The theory has n compared to laboratory experiments. The d loss in storm sewer manholes was shown to considerably smaller than the values calculated raditional formulas. (Author's abstract)

Journal of Hydraulic Engineering (ASCE) JHEND8, Vol. 116, No. 11, p 1329-1344, November 1990. 2 fig, 8 tab, 10 ref, 3 append. National Science Foundation grant ECE-861205.

Descriptors: *Hydraulic engineering, *Network design, *Pipe flow, *Pipes, *Steady flow, Algorithms, Calibrations, Mathematical equations, Numerical analysis, Water pressure.

An iterative solution of the full set of continuity and energy equations provides a powerful technique for the determination of steady-state pressure and flow conditions in pipe networks. An explicit algorithm is presented for directly determining a variety of design, operating, and calibration parameters for pipe networks. The problem solution is based on the reformulation of the steady-state network equilibrium equations in terms of specified pipe-system parameters. Since these equations are nonlinear, the incremental Newton-Raphson method is used as the basic solution procedure. A continuous variable space is assumed for the various parameters, which are selected to exactly satisfy stated pressure and flow requirements at critical nodes and pipes throughout the pipeline systems for a range of operating conditions. This approach offers a basis for determining the optimum values for the various design, operating, and calibration parameters in the sense that the parameters can be calculated to exactly meet the specified pressure and flow constraints. All types of pipe distribution systems can be considered. The solution space is secured through a well-arranged interaction between network topology, boundary constraints, and network parameters. The feasibility and flexibility of the proposed approach were demonstrated successfully using an example network. (Author's abstract)

FIRST STEP AWAY FROM LACEY'S REGIME EQUATIONS.
M. A. Stevens, and C. F. Nordin.
Journal of Hydraulic Engineering (ASCE) JHEND8, Vol. 116, No. 11, p 1422-1425, November 1990. 1 fig, 1 tab, 9 ref.

Descriptors: *Alluvial channels, *Canal design, *Channel morphology, *Hydraulic engineering, *Mathematical equations, *Sediment transport, Channel flow, Regime channels, River mechanics, Stable channels.

The problem of designing stable canals is in determining what nature would choose for the width, depth, and bed slope of the channel to convey both water and sediment from one point to another if the water and sediment are to flow in a self-formed alluvial channel, when the design discharge and an accompanying sediment concentration of known size are given. Lacey's regime equations explicitly address all issues except rate of sediment transport. The substitution of the sediment concentration in place of Lacey's silt factor is a simple improvement to Lacey's equations because it is a first step toward reformulating the design equations more rigorously on the basis of conservation laws and Newton's laws of motion. As with Lacey's equations, the new set has very limited application. They are for 0.1-0.3-sand; concentrations are less than 100 mg/L; the velocity should be within 0.5-2.5 ft/sec (0.14-0.75 m/s); and the bank material must have enough strength to resist erosion by these velocities. For conditions outside these limitations, another set of regime equations must be developed. (Fish-PTT)

DEVELOPMENT OF TURKEY'S ELECTRIC ENERGY.
State Hydraulic Works, Ankara (Turkey).
F. Anik.
International Water Power and Dam Construction IWPCDM, Vol. 42, No. 9, p 9-10, September 1990. 1 fig, 6 tab.

Descriptors: *Electric power production, *Hydroelectric plants, *Hydroelectric power, *Turkey, *Water resources development, Administrative agencies, Electric power demand, Future planning, Privatization.

Turkey has 4200 megaWatts (MW) of hydroelectric power presently under construction, and a further 6799 MW planned for projects to be implemented after 1991. The State Hydraulic Works (DSI-Devlet Su Isleri) and the Turkish Electricity Authority (TEK-Turkiye Elektrik Kurumu) are the principal organizations which distribute electric energy in Turkey. The DSI was established in 1953 as a public organization for the development of surface water and groundwater resources in Turkey. After construction of a hydroelectric power plant has been completed, operation becomes the responsibility of TEK. Since the government terminated the monopoly in electric power of TEK in 1984, the private sector has been licensed to construct and operate 20 hydro plants with a total installed capacity of 2062 MW. Turkey covers an area of 779,500 sq km and has an estimated average annual runoff of 186 sq km from its 26 river basins. At present 477 hydropower projects, with a total installed capacity of 34,892 MW, have been studied in Turkey either at masterplan level or to the feasibility stage. Of the current total average annual production of 24,293 gigaWatts (GW), 73% is produced at the five largest stations. According to the latest forecast, electric energy generation is likely to increase by 8.5% per year on average until the year 2010. (MacKeen-PTT)

SOVIET DESIGN OF LARGE TURBINES FOR WIDE HEAD RANGES.
V/O Hydroproject, Moscow (USSR).
M. F. Krasilnikov, and V. A. Linyuchev.
International Water Power and Dam Construction IWPCDM, Vol. 42, No. 8, p 34-35, 38-39, August 1990. 4 fig, 2 tab.

Descriptors: *Dams, *Hydraulic machinery, *Hydroelectric plants, *Turbines, *USSR, Design cri-

teria, Economic aspects, Hydraulic equipment, Hydraulic structures, Hydraulic turbines, Hydroelectric power.

The staged construction of large scale projects in the USSR can make a substantial contribution to the return on capital investment because of the large amount of extra electricity which can be produced during the initial low-head stage. This poses new challenges for the design of electromechanical equipment to operate over a wide head range. Three types of equipment are used in such cases, selected on the basis of a technical and economical feasibility study for the specific conditions of the project site. A turbine with a wide range of allowable operating heads may be selected (such as a Kaplan, Francis, or Deriaz turbine), temporary runners with an increased specific speed may be installed for the period of operation at low heads, or two-speed generators may be installed. All three of these options have been used successfully for large scale projects in the USSR. Diagonal flow turbines for operation under a wide range of heads have been installed at the Zeya and Kolyma hydropower plants. Temporary runners in Francis turbines have been installed at Nurek and Sayano-Shushensk, and two-speed generators were installed at the Rogun dam project. Although all of these schemes involve some unrecoverable costs, the power generated during the low-head phase will normally justify the additional expense. (Tappert-PTT)

NEW APPROACH TO TURBINE SPEED.
Monenco Consultants Ltd., Montreal (Quebec).
J. L. Gordon.
International Water Power and Dam Construction IWPCDM, Vol. 42, No. 8, p 39, 41-43, 46, August 1990. 2 fig, 4 tab, 4 ref.

Descriptors: *Hydraulic machinery, *Hydraulic turbines, *Hydroelectric plants, *Turbines, Estimating equations, Hydraulic equipment, Hydraulic structures, Hydroelectric power.

Current practice in the turbine industry for determination of turbine speed is to develop empirical formulae for each type of turbine, relating specific speed to the net head. Turbine runner speed thus becomes a function of head, diameter, and runner throat velocity. Both the number of runner blades and the runner speed have an influence on the turbine speed. By including the number of runner blades and the type of draft tube, it is possible to develop a more accurate equation for speed, with one equation covering all types of reaction (pit, bulb, Kaplan, propeller, and Francis) turbines. The new equation is based on an analysis of 155 turbine units. By including the number of runner blades or buckets, and a factor for the type of draft tube, accuracy of the equation is within plus or minus 15 per cent for 88 per cent of the units. The database includes turbine heads ranging from 3 m to 500 m, throat diameters from 1 m to 9 m, throat velocities from 6 m/s to 14 m/s, blade numbers from 3 to 19, and runner speeds from 50 to 750 rev/min. With a larger database, including more high head, high speed Francis units, the equation could be refined further to increase accuracy. The new speed equation is not proportional to the square root of flow. (Tappert-PTT)

Descriptors: *Hydraulic machinery, *Hydraulic turbines, *Hydroelectric plants, *Mexico, *Turbines, Electrical equipment, Hydraulic equipment, Hydraulic structures, Hydroelectric power, Performance evaluation, Pressure-measuring instruments.

A study of four Mexican powerplants with Francis turbines examined turbine behavior working under partial loads. The study included a literature review, laboratory experiments, and field prototype measurements. Previous studies suggest that because of the forced vortex core precession movement, hydroelectric power systems are subject to the action of pulsating pressures with frequencies from 25 to 50 per cent of the turbine rotational speed. Pressure transducer data collected at four hydroelectric plants identified pressure fluctuations with frequencies of about 25 per cent of the turbine rotational speed when the discharge through the turbines was close to half of the design discharge. When the discharge was in the range of 25 to 35 per cent of the design discharge, and the total head was close to or larger than the design head, higher pressure fluctuations were produced in three of the four plants with frequencies beyond the predicted range. Laboratory data collected from two vortex generators suggested that to attain large head pressure fluctuations it is not sufficient for one of the exciter frequencies to fit with the system main frequency, but it is necessary to get a certain combination of head and discharge acting simultaneously. A simple procedure has been developed, based upon the transfer matrix method, to predict the behavior of hydroelectric machinery under diverse operating conditions. The numerical results are in good agreement with field prototype measurements. (Tappert-PTT)

UPGRADING PROCUREMENT SPECIFICATIONS FOR HYDROELECTRIC MACHINES.
Harza Engineering Co., Chicago, IL.
R. W. Fazalare.
International Water Power and Dam Construction IWPCDM, Vol. 42, No. 8, p 54-56, August 1990. 2 fig, 4 ref.

Descriptors: *Hydraulic equipment, *Hydraulic machinery, *Hydroelectric plants, *Mechanical engineering, *Testing procedures, *Turbines, Computer models, Design criteria, Electrical equipment, Finite element method, Hydraulic structures, Hydraulic turbines, Hydroelectric power.

Specifications for large custom-designed hydraulic machines are in urgent need of upgrading. These typically specify the structural integrity around a nominal design stress of the material, and the hydraulic design around laboratory model tests based on similar units. However, advanced tools available today, such as computer-based finite element analysis, fracture mechanics analysis, and computer modeling of flow and dynamic behavior, are considered mandatory in the modern design of custom hydro machines. In view of the lack of formally adopted guidelines these new design techniques should be required in the specifications, with the detailed design criteria to be agreed between the manufacturer and the engineer. The integrated design analysis should include cyclic loading for a 50 year machine life, a finite element analysis of all major components to determine stress level and material requirements, a fracture mechanics analysis of all materials to determine critical size defect and crack growth propagation rate as well as fatigue stress levels, a dynamic vibration analysis determining amplitude and frequency of each major component, a dynamic analysis of the unit's rotating system covering running clearances, bearing spring constants, etc., and a series of computer model simulation flow analyses to optimize the hydraulic design of the turbine runner and the distribution and cascading of flow through the guidevanes, spiral case and draft tube. Historically, damage to lightweight buildings in eastern Canada has often resulted from soil volume changes beneath shallow foundations, due to seasonal moisture variation and clay shrinkage caused by tree roots. During the exceptionally dry summer of 1983, extensive settlement problems developed in lightweight buildings founded in the clay deposits of the Montreal area. A modified budget that keeps a running balance of precipitation and potential evapotranspiration (PET) is applied to the region of study to obtain the soil moisture depletion or rainfall deficit throughout the period 1930-1988. Potential evapotranspiration was estimated using the methods of Thornthwaite, Penman, Blaney and Criddle, and Turc. The Blaney and Criddle method provides the highest estimate for PET. Detailed monthly rainfall deficits were calculated using the method of Thornthwaite. Based upon that method, a rainfall deficit of 170 mm/month is proposed as a threshold value. Above this value, foundation problems are likely to occur in the shrinkable eastern Canadian clays. Different limiting values of the rainfall deficit would be calculated by the other three methods. By calculating the rainfall deficit it is possible to predict whether a particular summer will be relatively wet or relatively dry, and take corrective measures if necessary. Because the climatic and soil conditions in Montreal are similar to those in the St. Lawrence Lowlands, it is believed that these findings apply equally well to those regions. (Tappert-PTT)

PORE PRESSURE FIELD BUILT UP IN A RAPIDLY ERODED SOIL MASS.
Basilicata Univ., Potenza (Italy). Ist. di Geologia e Geotecnica.
G. B. Fenelli, and L. Picarelli.
Canadian Geotechnical Journal CGJOAH, Vol. 27, No. 3, p 387-392, June 1990. 11 fig, 10 ref.

Descriptors: *Clays, *Erosion, *Interstitial water, *Landslides, *Model studies, *Pore pressure, *Slope stability, *Soil mechanics, Expansive clays, Italy, Mathematical models, Piezometers, Soils.

Recent investigations indicate a growing interest in the relationship of pore pressure fields and slope stability in clay formations, particularly with respect to delayed failure. A simple one-dimensional

nodel developed to examine the pore pressure esponse of a saturated soil mass of finite thickness, ubject to a constant rate of erosion, suggests that he valley bottom of some American and Canadian ivers could still be subject to vertical swelling eformations from geological erosion. A clay for- nation near the town of Bisaccia in the Italian ppenines provides a test of this model; the valleys re subject to progressive widening due to sliding henomena. Both in situ and laboratory tests were onducted to investigate the subsoil structure, soil roperties, and groundwater regime. Good quality ndisturbed samples have been collected and tested or plasticity, shrinkage limit, compressibility, and welling index. Pore pressure fields were deter- ined by installing a number of Casagrande piezo- eters and vibrating wire piezometric cells. The ata indicate that the superficial debris cover may e considered as a water reservoir characterized y an almost constant piezometric head very close the ground surface. In the underlying clay mate- als, the piezometric head is almost constant with me, and gradually decreases with depth. Exclud- g the presence of a deep draining layer, this nfirms the hypothesis that the present pore pres- re field is a consequence of the still active ero- on phenomena. Application of the one-dimen- onal model to the data obtained in the clay results a model swelling coefficient of 0.03 sq m/yr, nsistent with the laboratory results. (Tappert-TT)

nadian Geotechnical Journal CGJOAH, Vol. No. 4, p 472-483, August 1990. 14 fig, 4 tab, 18

scriptors: *Compressive strength, *Frozen soils, athematical models, *Soil physical properties, oil strength, *Soil temperature, *Soil texture, oil water, Frozen ground, Particle size, Stress.

nstant strain-rate (0.01/s) uniaxial compression- ngth tests were conducted on more than 200 urated samples of six fine-grained frozen soils at peratures between -5 and -17 C. Saturated soil ples containing total water contents between % and 105% were prepared using a consolida- apparatus specially designed for this purpose. e effect of dry unit weight, total water content, perature, and soil type on the behavior of peak mpressive strength was studied. Test results indi- e the peak compressive strength of fine-grained s was sensitive to changes in the dry unit ght and the total water content. The tempera- e dependence of the peak compressive strength epresented by a simple power law. An empirical nula was developed to predict the peak com- ssive strength of fine-grained frozen soils at a ticular temperature using index properties, spe- c surface area, particle-size distribution, and dry weight. A linear relationship existed between peak compressive stress and the yield stress. wever, more experimental studies are necessary nderstand clearly the compressive-strength be- ior of fine-grained frozen soils with very high unit weights. GEOPHYSICAL INVESTIGATION--SOUTH-WESTERN GREAT ARTESIAN BASIN.
C. D. Cockshell.
Mines and Energy Review South Australia, No. 157, p 62-67, 1990. 7 fig, 5 ref.

Descriptors: *Aquifer characteristics, *Aquifer systems, *Australia, *Geophysical surveys, Aquifers, Bedrock, Confined aquifers, Geohydrology, Geologic formations, Geologic fractures, Great Artesian Basin, Lake Eyre South, Resistivity, Seismic exploration.

Three geophysical surveys near Lake Eyre South, have indicated complex structural controls affecting the Cretaceous-Jurassic aquifer sequence along the southwestern margin of the Great Artesian Basin. Seismic surveys in 1985 and 1987 indicated that northwesterly trending Adelaidean bedrock highs, bounded by a system of northwest-southeast trending faults, extend into the basin. Bedrock shale, siltstone and quartzite are generally impervious except where fractured by faulting and weathering. Over these highs the aquifer sequence can be moderately well developed, but heavily faulted such as between Roxby Management Services Borefield A and its associated 'northeastern sub-basin'. Alternatively, it can be thinly developed, lenticular or absent altogether, such as northeast of the Borefield 'sub-basin' and southwest of Lake Eyre South. These restrictions on aquifer development subsequently control aquifer recharge to the basin margins as shown by the southeasterly recharge direction into Borefield A. Electromagnetic and electrical resistivity data provided information on thickness and resistivities of the near-surface layers and on the resistivity of Bulldog Shale, which overlies the aquifer sequence. However, very low resistivities of units above the aquifer severely affect the penetration of these methods and hence limit the confidence of interpreting aquifer and bedrock parameters. RELATIONSHIP OF RESERVOIR BIOGEOCHEMICAL PROCESSES TO THE STRUCTURAL INTEGRITY OF THE WORLD'S FIRST TOTALLY ROLLER COMPACTED CONCRETE DAM.
Army Engineer District, Portland, OR. Reservoir Regulation and Water Quality Section.
D. W. Larson.
Ergebnisse der Limnologie ERLIA6, Vol. 33, No. 3, p 949-964, 1990. 9 fig, 5 tab, 12 ref.

Descriptors: *Concrete dams, *Concrete technology, *Corrosion, *Dam failure, *Geochemistry, *Limnology, *Phytoplankton, *Reservoirs, *Seepage, *Sulfur bacteria, Aeration, Grouting, Hydrogen sulfide, Lime, Oregon, Oxygen, Sulfuric acid, Willow Creek Dam.

Willow Creek Dam is a U.S. Army Corps of Engineers flood-control project located on a tributary of the Columbia River in Oregon. This project, completed in 1983, is the world's first dam to be built entirely with roller compacted concrete. The dam is 550 m long and 50 m high (streambed to dam crest). Willow Creek Reservoir is extremely eutrophic and is well stratified thermally during the summer. By August, the reservoir's hypolimnion is anoxic and contains high concentrations of hydrogen sulfide and other chemically reduced substances. Heavy phytoplankton blooms, principally of Aphanizomenon flos-aquae, aggravate water quality problems in the impoundment. Apparent defects in the dam's concrete matrix have provided avenues for substantial leakage of hypolimnetic waters. Seepage entering the dam's tunnels and gallery is highly enriched with hydrogen sulfide and dissolved lime. There is concern that oxidation of hydrogen sulfide by chemosynthetic bacteria, producing sulfuric acid, is corroding the dam's concrete. Extensive deposition of calcium carbonate on the gallery walls and floor suggests that deterioration of the concrete is occurring. Studies are underway on the geochemistry, microbiology, and hydrodynamics of seepage waters to determine whether the structural integrity of the dam is in fact at risk. Methods under study to solve this problem include hypolimnetic aeration to maintain deepwater oxygen during summer, thus preventing the buildup of hydrogen sulfide, and further injection of cement grout into the concrete matrix to hopefully arrest the seepage. (Author's abstract)

SURFACE TREATMENTS TO MINIMIZE CONCRETE DETERIORATION. REPORT 2: LABORATORY EVALUATION OF SURFACE TREATMENT MATERIALS.
Army Engineer Waterways Experiment Station, Vicksburg, MS. Structures Lab.
T. B. Husbands, and F. E. Causey.
Available from the National Technical Information Service, Springfield, VA 22161. Technical Report REMR-CS-17, September 1990. Report 2 of a Series. 102 p, 25 fig, 26 tab, 18 ref.

Descriptors: *Concrete testing, *Concretes, *Maintenance, *Materials testing, Concrete structures, Freeze-thaw tests, Polymers, Polypropylene, Shotcrete, Weathering.

In 1984, the US Army Corp of Engineers initiated a research program designated Repair, Evaluation, Maintenance, and Rehabilitation (REMR). One of the REMR work units was the evaluation of surface treatments to minimize concrete deterioration. Many of the Corp's hydraulic structures have experienced concrete surface deterioration due to: (1) freezing and thawing, (2) aggressive chemical exposure, and (3) erosion. Surveys by Corp personnel have shown that freezing and thawing was the major contributing factor to concrete surface deterioration followed by erosion. Many different types of surface treatments were evaluated under this work unit including concrete sealers, coatings, polymer systems, thin overlays, and shotcrete. Emphasis was placed on materials that could be applied to the surface to reduce or prevent damage to concrete by freezing and thawing. Polymer systems for sealing cracks by topical application and elastomeric coatings for coating cracked concrete were evaluated. Other coatings for protecting concrete from erosion, chemical attachment, and graffiti were also evaluated. The siloxanes showed promise as a generic type of sealer for concrete and clay bricks on all tests, except for resistance to freezing and thawing. Some of the elastomeric acrylic coatings can be used for coating cracked concrete if the cracks are narrow (hairline), based on good weatherability, elastomeric properties, and breathability of these coatings. The addition of latex admixtures to shotcrete improves the freeze-thaw durability of the material. Polypropylene fibers appear to reduce drying/cracking of latex-modified shotcrete. MONITORING SYSTEM FOR DETECTING MOVEMENTS OF PENSTOCK SUPPORTS.
Waagner-Biro A.G., Graz (Austria). Research and Development Centre.
G. Rop, and M. Bobik.
International Water Power and Dam Construction IWPCDM, Vol. 42, No. 9, p 23-25,28, September 1990. 8 fig.

Descriptors: *Dam construction, *Dams, *Measuring instruments, *Monitoring, *Penstocks, *Seismic properties, Data acquisition, Hydroelectric plants, Kokluce Hydropower Station, Movement

detection, Penstock supports, Strain gages, Turkey.

A monitoring system for the detection of movement of penstock supports was developed for the Kokluce hydropower station, located in a seismic area in eastern Turkey. Wire strain gauges are attached to the penstocks in the areas of maximum tensile strength and compressive stresses and are compensated for temperature by the half-bridge circuit method. The monitoring system comprises three data acquisition and control units, in which the analog data from the strain gauge amplifiers are converted to digital values, a data logger, a printer and an alarm. The normal working order of the powerplant with a capacity of 60 MW was used as the reference load condition. As the monitoring system covers a length of almost 2 km, overvoltage and lightning protection are important parts of the system. Since beginning operation at the end of 1988, no hardware or software problems have occurred. Advantages of the system include reliability, low cost, and suitability for retrofitting at completed and operating stations. (MacKeen-PTT)

TURBINE-INTAKE FISH-DIVERSION SYSTEM.
Iowa Inst. of Hydraulic Research, Iowa City.
A. J. Odgaard, R. A. Elder, and D. Weitkamp.
Journal of Hydraulic Engineering (ASCE) JHEND8, Vol. 116, No. 11, p 1301-1317, November 1990. 7 fig, 1 tab, 5 ref. Public Utility District of Grant County, Washington contract No. 430-209; Ebasco Services, Inc., Bellevue, Washington contract No. ES-7264.

Descriptors: *Fish guiding, *Fish management, *Fish passages, *Hydraulic engineering, *Turbines, Field tests, Fish migration, Hydroelectric plants, Intake gates, Salmon, Washington.

A promising method for protecting downstream-migrating juvenile fish form death or injury due to passage through hydroelectric turbines is diversion by screening in the turbine intakes. A fish-diversion system was developed to be used in the turbine intakes of the Wanapum and Priest Rapids developments on the Columbia River, in the state of Washington. The system uses a passive-bar screen, installed through the emergency gate well, to produce a flow pattern that deflects downstream-migrating juvenile salmonids into the gate well for subsequent removal and bypass to below the dam. The system is based on laboratory model studies and field tests. The model studies provide data on the hydraulic performance of the system and result in an understanding of the hydraulic features of the technique, which can be a guide for future designs. The studies also serve as a guide to development of the structural design of the system. The design, field tested in 1986, 1987, and 1988, attains a fish-guidance efficiency of about 68% with a minimal of descaling (removal of fish scales by abrasion). (Author's abstract)

9. MANPOWER, GRANTS AND FACILITIES

9A. Education (Extramural)

WILLIE TAKES A FIELD TRIP COLORING BOOK.
Geological Survey, Indianapolis, IN. Water Resources Div.
D. V. Arvin.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 90-125, August 1990. 37p, 37 fig.

Descriptors: *Children's educational material, *Data acquisition, *Hydrologic data, *Indiana, *Publications, Field tests, Field trip.

This coloring book is an educational tool designed to instruct children on some of the field activities commonly associated with the collection of water resource data. Through the use of line drawings and brief descriptive text, young readers will follow little Willie and his Uncle Bill as they spend a pleasant day in the field measuring streamflow, collecting sediment samples, making groundwater measurements at observation wells, and measuring flow in a pipe. Although this 37-page coloring book is geared to children 5 to 10 years old, people of all ages may find it enjoyable. (USGS)

WATER RESEARCH IN AUSTRALIA: CURRENT PROJECTS 1989.
Department of Primary Industries and Energy, Canberra (Australia).
Australian Government Publishing Service, Canberra, Australia. 1990. 163 p.

Descriptors: *Australia, *Bibliographies, *Foreign research, *Water resources research, Annual reports, Data collections, Research facilities.

This Annual Publication incorporates about 1000 summaries of water-related research projects currently being undertaken in Australia by individuals and research organizations. Research projects are grouped according to broad subject categories, and within these are listed in alphabetical order by project title. Two indexes allow retrieval by the names of members of the research team and the organizations carrying out or sponsoring the research, and by subject, using terms from the Aqualine thesaurus and additional Australian terms. Information included in this publication is taken from the Australian computerized data base, Streamline. (Author's abstract)

IBLIOGRAPHY OF U.S. GEOLOGICAL URVEY REPORTS ON THE WATER RE-OURCES OF FLORIDA, 1886-1989.
eological Survey, Tallahassee, FL. Water Re-urces Div.
L. Embry, and N. D. Hoy.
vailable from Books and Open File Report Sec-on, USGS, Box 25425, Denver, CO 80225. USGS pen-File Report 90-143, 1990. 196p, 1 fig. Project o. FL-002.

escriptors: *Bibliographies, *Florida, *Ground-ater, *Surface water, *Water quality, *Water re-urces data.

ne U.S. Geological Survey has released a listing its reports on water resources in Florida for the riod 1886-1989. Most of the reports contained in e listing were prepared by the U.S. Geological rvey in cooperation with numerous public agen-es in Florida. The compilation has a full biblio-aphic list of reports arranged alphabetically by nor author. In addition, the reports are indexed geographic areas and by subject. (USGS)

ADVECTION
Localized Adjoint Methods: Application to Advection Dominated Flows.
W91-02702 2F

Application of the Arnoldi Algorithm to the Solution of the Advection-Dispersion Equation.
W91-02883 5B

AERATION
Possible Importance of Wind Aeration in Controlling Odours from Piggery Slurry Stored after Aerobic Treatment.
W91-02772 5D

AERATION ZONE
Some Aspects of Soil Moisture Control for Soils with Shallow Groundwater Levels.
W91-02674 2G

Uncertainty Propagation with Numerical Models for Flow and Transport in the Unsaturated Zone.
W91-02875 2G

Immobile Water During Solute Transport in Unsaturated Sand Columns.
W91-02876 2G

AERIAL PHOTOGRAPHY
PC-Based Analytical Stereoplotter for Wetland Inventories: An Efficient and Economical Photogrammetric Instrument for Field Offices.
W91-02503 7B

Classification of Mangrove Forest by Using 1:40,000-Scale Aerial Photographs.
W91-02504 2H

Use of High-Altitude Aerial Photography for Inventorying Forested Wetlands in the United States.
W91-02505 2H

AEROBIC DIGESTION
Continuous Pre-Anoxic and Aerobic Digestion of Waste Activated Sludge.
W91-02572 5D

Acute Toxicity of Heavy Metals to Aerobic Digestion of Waste Cheese Whey.
W91-02776 5D

Reductions of Enteric Microorganisms During Aerobic Sludge Digestion.
W91-02794 5D

AEROBIC TREATMENT
Possible Importance of Wind Aeration in Controlling Odours from Piggery Slurry Stored after Aerobic Treatment.
W91-02772 5D

AEROSPACE INDUSTRY
Hazardous Waste Minimization: Source Reduction Alternatives in the Aerospace Industry.
W91-02411 5D

AFRICA
State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa.
W91-02288 2A

General Characteristics of Surface Hydrology in Arid and Semi-arid Areas of Africa and Their Consequences for Development (Caracteres Generaux de l'Hydrologie Superficielle des Zones Arides et Semi-Arides en Afrique: Leurs Consequences sur les Etudes des Ingenieurs).
W91-02290 2E

CIEH's Contribution to the Development of Hydrology in Arid and Semi-Arid Areas in Africa (Contribution du CIEH au Developpement de l'Hydrologie dans les Zones Arides et Semi-arides d'Afrique).
W91-02292 2A

Advances Towards Water Resources Development Through Hydrological Training and Education.
W91-02293 6E

USGS LIBRARY

AFRICA

Contribution of CIEH in the Field of Hydrogeology (Contribution du CIEH dans le Secteur de l'Hydrologie).
W91-02294 2A

Towards a Regional Water Resource Study of Arid and Semi-arid Africa.
W91-02295 2A

Impact of Soil Surface Deterioration on Runoff Production in the Arid and Semi-arid Zones of West Africa.
W91-02296 4C

Surface Features: One of the Key Elements of Sahelian Hydrology (Les Etats de Surface: Une des Clefs de l'Hydrologie Sahelienne).
W91-02297 2A

Water Losses in the Nile Basin.
W91-02298 2A

Evaporation from Free Water Surfaces in the Sudano-Sahelian Climate (L'evaporation des nappes d'eau libre en climat soudano-sahelien).
W91-02300 2D

Electronics and Informatics for the Acquisition of Hydrometeorological Data: A Great Tool for Water Resource Management in the Sahel (Electronique et Informatique pour l'Acquisition des Donnees Hydrometeorologiques, un Outil Prodigieux pour la Gestion des Ressources en Eau dans le Sahel).
W91-02303 7B

Predetermination of Floods in Small Sahelian Basins under 10 Square Kilometers (La Predeterminatione des Crues sur des Petits Bassins Saheliens Inferieurs a 10 km2).
W91-02305 2E

Unit Hydrograph Technique Applied to Sahelian Flood Modeling: Comparison of Different Identification Methods (L'Hydrogramme Unitaire Applique a l'Analyse des Crues au Sahel: Comparaison de Differentes Methodes d'Identification).
W91-02309 2E

Hydrologic Design and Development of Hydraulic Structures.
W91-02312 8A

Interflux Dams: Their Advantage for Saharan and Sahelian Africa (Les Barrages d'Inferoflux: Leur Interet pour l'Afrique Saharienne et Sahelienne).
W91-02313 8A

Water Transfer in Porous Non-Saturated Rock and Aquifer Recharge in the Sudano-Sahelian Climate (Transfert d'Eau en Milieu Poreux non Sature Recharge des Nappes en Climat Soudano-Sahelien).
W91-02319 2F

Groundwater Quality in Rural Areas in Western Africa.
W91-02336 2F

Turbulent Flow Theory for African Regoliths.
W91-02344 2F

Problems of Maintenance of Water Quality in Arid and Semi-Arid Regions of West Africa.
W91-02348 5G

Scientific and Technical Evaluation of Mathematical Models in the Planning Design and Operation of Hydrosystems in Africa.
W91-02350 2E

Use of Personal Computers for the Analysis and Management of Hydrometeorological and Groundwater Data.
W91-02351 7C

Hydrological Network, Data Banks, and Teletransmission (Reseaux Hydrologiques, Banques de Donnees Informatisees et Teletransmission).
W91-02352 7B

Teletransmission of Hydrological Data Within the Framework of the Programme to Combat Onchocerciasis (Teletransmission des Donnees Hydrologiques dans le Cadre du Programme de Lutte Contre l'Onchocercose).
W91-02353 7B

Arrival of a Generation of Field Expert Systems (L'Avenement d'une Generation de Systemes Expertes de Terrain).
W91-02354 7C

State of the Art Hydrology for the Development of Sahelian Water Resources.
W91-02355 2F

Post Graduate Course in Hydrology and Hydrogeology (Formation Post-Universitaire en Hydrologie et Hydrogeologie).
W91-02363 6E

Impact of Climatic Changes on Surface Water Resources in West and Central Africa (Impact des Changements Climatiques sur les Ressources en Eau de Surface en Afrique de l'Ouest et Centrale: L'Experience de l'OSTROM).
W91-02368 7A

Diel and Seasonal Energy Transfer, Storage and Stratification in African Reservoirs and Lakes.
W91-02370 2H

AGRICULTURAL CHEMICALS

Fate of Parathion in Ground Water in Commercial Cranberry Culture in the New Jersey Pinelands.
W91-02098 5B

Persistence of Aldicarb Residues in the Sandstone Aquifer of Prince Edward Island, Canada.
W91-02160 5B

Agricultural Pesticides and Groundwater in North Carolina: Identification of the Most Vulnerable Areas.
W91-02245 5G

AGRICULTURAL RUNOFF

Organic Selenium Distribution in Selected California Soils.
W91-02134 5B

Septic Tank and Agricultural Non-Point Source Pollution Within a Rural Watershed.
W91-02177 5B

Effect of Field-scale Solute Infiltration into Groundwater on Surface Water Quality.
W91-02683 5B

AGRICULTURAL WATER

Impact of Water Control on Navajo Irrigation Projects.
W91-02278 3F

State of the Art Hydrology for the Development of Sahelian Water Resources.
W91-02355 2F

Use of Run Off on Cultivated Fields in the Sudan-Sahelian Area: Burkina Faso, Yatenga Province, Bidi Region (Valorisation Agricole des Eaux de Ruissellement en Zone Soudano Sahelienne: Burkina Faso, Province du Yatenga, Region de Bidi).
W91-02365 3F

Agricultural Water Use Monitoring Through Landsat Surveillance.
W91-02600 3F

Access of Small and Marginal Farmers to Groundwater--A Field Study.
W91-02675 4B

AGRICULTURAL WATERSHEDS

Septic Tank and Agricultural Non-Point Source Pollution Within a Rural Watershed.
W91-02177 5B

Predicting Runoff from Rangeland Catchments: A Comparison of Two Models.
W91-02869 2E

AGRICULTURE

Fate of Parathion in Ground Water in Commercial Cranberry Culture in the New Jersey Pinelands.
W91-02098 5B

Hydraulic Working of Shallow Waters in West Africa (Fonctionnement Hydrologique des Bas Fonds en Afrique de l'Ouest).
W91-02314 4A

Irrigation Trials: Basis for the Design of Furrow Systems.
W91-02315 3F

AIR POLLUTION

Chemical Constituents of Precipitation and Their Role in Determining Its Acidity in Bombay.
W91-02829 5B

Computer-Controlled Automated Rain Sampler (CCARS) for Rainfall Measurement and Sequential Sampling.
W91-02914 7B

AIR POLLUTION EFFECTS

Calcium Metabolism in Two Populations of the Snail Helix aspersa on a High Lead Diet.
W91-02205 5C

Elevated Atmospheric CO2 Effects on Belowground Processes in C3 and C4 Estuarine Marsh Communities.
W91-02406 5C

Influence of Precipitation on the Quality of Karst Groundwater in Industrial Zones.
W91-02686 5B

Influence of Acid Atmospheric Inputs on Surface Water Chemistry and Mineral Fluxes in a Declining Spruce Stand Within a Small Catchment (Vosges Massif, France).
W91-02741 5B

ALABAMA

DDT Contamination of Benthic Macroinvertebrates and Sediments from Tributaries of Wheeler Reservoir, Alabama.
W91-02442 5B

ALASKA

Characteristics of Coarse Wood Debris for Several Coastal Streams of Southeast Alaska, USA.
W91-02063 4C

Geohydrology and Groundwater Geochemistry at a Sub-Arctic Landfill, Fairbanks, Alaska.
W91-02253 5B

Fathometer Data from Bart Lake and Lake Dorothy Near Juneau, Alaska, 1988-89.
W91-02254 7C

Activities of the Alaska District, Water Resources Division, U. S. Geological Survey, 1990.
W91-02259 7C

Woody Plant Succession on Earthquake-Uplifted Coastal Wetlands of the Copper River Delta, Alaska.
W91-02498 2H

ALBERTA
Integrated Approach to Quantify Groundwater Transport of Phosphorus to Narrow Lake, Alberta.
W91-02589 2F

Origin and Evolution of Formation Waters, Alberta Basin, Western Canada Sedimentary Basin: I. Chemistry.
W91-02888 2K

Origin and Evolution of Formation Waters, Alberta Basin, Western Canada Sedimentary Basin. II. Isotope Systematics and Water Mixing.
W91-02889 2K

ALDICARB
Persistence of Aldicarb Residues in the Sandstone Aquifer of Prince Edward Island, Canada.
W91-02160 5B

Fate of Aldicarb in the Unsaturated Zone Beneath a Citrus Grove.
W91-02859 5B

ALEWIFE
Large-Lake Responses to Declines in the Abundance of a Major Fish Planktivore--The Lake Michigan Example.
W91-02073 2H

ALGAE
Influence of the Herbicide Paraquat 'Gramaxon' on Growth and Metabolic Activity of Three Chlorophytes.
W91-02085 4A

Modelling Phytoplankton Productivity in Turbid Waters with Small Euphotic to Mixing Depth Ratios.
W91-02115 2H

Changes in Seasonal Succession of Phytoplankton Induced by the Storm-Surge Barrier in the Oosterschelde (S.W. Netherlands).
W91-02116 2L

Summary of Biological Investigations Relating to Surface-Water Quality in the Kentucky River Basin, Kentucky.
W91-02232 5C

Long-term Trends in the Seston Content of a Shallow Eutrophic Lake and Some Relations to Climatic Elements.
W91-02374 2H

Water Quality of Some Reservoirs.
W91-02391 5A

Key Factors in Taste and Odour Problems for Municipal Water Works Using Surface Water Sources.
W91-02394 5F

Organic Solvent-Soluble Contents of Nickel and Cobalt in Some Algae.
W91-02401 5B

Toxic Effects of Tetraethyl Lead and Its Derivatives on the Chrysophyte Poteriochromonas malhamensis: VIII. Comparative Studies with Surfactants.
W91-02432 5C

Fucus vesiculosus as an Indicator of Heavy Metal Availability in a Fish Farm Recipient in the Northern Baltic Sea.
W91-02560 5A

Metal-Organic Associations in Sediments--II. Algal Mats in Contact with Geothermal Waters.
W91-02892 2J

ALGAL BLOOMS
Response of the Microbial Loop to Phytoplankton Spring Bloom in a Large Prealpine Lake.
W91-02584 2H

ALGAL CONTROL
Large-Lake Responses to Declines in the Abundance of a Major Fish Planktivore--The Lake Michigan Example.
W91-02073 2H

Degradation of Blue Green Alga, Microcystis Aeruginosa by Flagellata, Monas Guttula.
W91-02826 5F

ALGAL GROWTH
Modelling Phytoplankton Productivity in Turbid Waters with Small Euphotic to Mixing Depth Ratios.
W91-02115 2H

Changes in Seasonal Succession of Phytoplankton Induced by the Storm-Surge Barrier in the Oosterschelde (S.W. Netherlands).
W91-02116 2L

Toxic Effects of Tetraethyl Lead and Its Derivatives on the Chrysophyte Poteriochromonas malhamensis: VIII. Comparative Studies with Surfactants.
W91-02432 5C

Foodweb Response to the Experimental Manipulation of a Benthivore (Cyprinus carpio), Zooplanktivore (Menidia beryllina) and Benthic Insects.
W91-02453 2H

ALGICIDES
Oxygen Uptake of Pseudosuccinea columella and Fossaria cubensis Treated with Sublethal Concentrations of CUTRINE-PLUS, an Algicide.
W91-02096 5C

ALGIERS BAY
Total Heavy Metal Concentrations Contained on the Sediment's Surface of Algiers Bay.
W91-02053 5B

ALIPHATIC HYDROCARBONS
In-Situ Aquifer Restoration of Chlorinated Aliphatics by Methanotrophic Bacteria.
W91-02650 5G

ALKALINITY
Sulfur Storage and Alkalinity Generation in New England Lake Sediments.
W91-02588 2H

Probability Model for Acid Rain Data.
W91-02787 5B

ALLUVIAL AQUIFERS
Hydrogeological and Geophysical Electromagnetic Study of the Alluvial Aquifer of Wadi Teloua, Agadez, Niger (Etude Hydrogeologique et Geophysique Electromagnetique de la Nappe Alluviale du Kori Teloua, Agadez, Niger).
W91-02323 2F

ALLUVIAL CHANNELS
Fan-Delta and Braid-Delta Systems in Pennsylvanian Sandia Formation, Taos Trough, Northern New Mexico: Depositional and Tectonic Implications.
W91-02519 2J

Width and Depth of Self-Formed Straight Gravel Rivers with Bank Vegetation.
W91-02865 2E

Turbulent Shear Stress in Heterogeneous Sediment-Laden Flows.
W91-02923 2J

First Step Away from Lacey's Regime Equations.
W91-02924 8B

ALPS
Floods of 1987 in the Glacial Basins Situated in Pennine Alps in Switzerland (Les Crues de l'ete 1987 dans les Bassins Versants Glaciaires des Alps Pennines).
W91-02049 2E

Remote Sensing Applied to Glacier Supervision in the French Alps (years 1986, 1987 and 1988)(Teledetection Appliquee au suivi des Glaciers des Alpes Francaises (annees 1986, 1987 et 1988)).
W91-02051 7B

ALTERNATIVE PLANNING
Application of the Analytic Element Method for National Groundwater Management in The Netherlands.
W91-02697 6A

ALUMINUM
Effects of pH, Aluminum, and Calcium on Survival and Growth of Eggs and Fry of Brook Trout (Salvelinus fontinalis).
W91-02103 5C

Effects of Water Acidity, Calcium, and Aluminum on Whole Body Ions of Brook Trout (Salvelinus fontinalis) Continuously Exposed from Fertilization to Swim-Up: A Study by Instrumental Neutron Activation Analysis.
W91-02104 5C

Whole Body Ions of Brook Trout (Salvelinus fontinalis) Alevins: Responses of Yolk-Sac and Swim-Up Stages to Water Acidity, Calcium, and Aluminum, and Recovery Effects.
W91-02105 5C

Epidermal Response to pH, Aluminum, and Calcium Exposure in Brook Trout (Salvelinus fontinalis) Fry.
W91-02106 5C

Responses of Brook Trout (Salvelinus fontinalis) Fry to Fluctuating Acid, Aluminum, and Low Calcium Exposure.
W91-02107 5C

Inorganic Monomeric Aluminum and pH as Predictors of Acidic Water Toxicity to Brook Trout (Salvelinus fontinalis).
W91-02108 5C

Aluminum and Acid Toxicity to Two Strains of Brook Trout (Salvelinus fontinalis).
W91-02109 5C

Variability in Concentrations of Selected Trace Elements in Water and Sediment of Six Acidic Lakes.
W91-02193 5B

Limitations to the Understanding of Ion-Exchange and Solubility Controls for Acidic Welsh, Scottish, and Norwegian Sites.
W91-02735 5C

Longitudinal Patterns of Concentration-Discharge Relationships in Stream Water Draining the Hubbard Brook Experimental Forest, New Hampshire.
W91-02743 5B

Geochemical Control of Aluminium Concentrations in Acidified Surface Waters.
W91-02752 5B

Towards Developing a New Short-Term Model for the Birkenes Catchment--Lessons Learned.
W91-02758 2K

ALUMINUM SULFATE
Aluminium Deposition in Bone After Contamination of Drinking Water Supply.
W91-02951 5C

AMAZON RIVER BASIN
Spatial Organization and Population Density of the Fish Community of the Litter Banks within a Central Amazonian Blackwater Stream.
W91-02414 2H

Wetland and Upland Forest Ecosystems in Peruvian Amazonia: Plant Species Diversity in the Light of Some Geological and Botanical Evidence.
W91-02479 2H

Seasonal Dynamics in Methane Emissions from the Amazon River Floodplain to the Troposphere.
W91-02834 2H

Methane Flux from the Amazon River Floodplain: Emissions During Rising Water.
W91-02837 2H

Sources and Sinks of Formic, Acetic, and Pyruvic Acids Over Central Amazonia. 2. Wet Season.
W91-02838 5B

Atmospheric Sulfur Cycle Over the Amazon Basin. 2. Wet Season.
W91-02839 5B

Precipitation Chemistry in Central Amazonia.
W91-02840 2B

Rainfall and Surface Kinematic Conditions Over Central Amazonia During ABLE 2B.
W91-02841 2B

Estimates of Daily Rainfall Over the Amazon Basin.
W91-02842 2B

AMES TEST
Rainbow Trout Liver Activation Systems with the Ames Mutagenicity Test.
W91-02217 5A

AMINO ACIDS
Monthly Variations of Dissolved Free Amino Acids (DFAA) Observed in the Bay of Villefranche-sur-Mer, France: Experimental Study on Their Uptake by Paracentrotus lividus and Sphaerechinus granularis Larvae (Variations Mensuelles des Acides Amines Libres Dissous (AALD) Presents en un Point de la rade de Villefranche-sur-Mer: Utilisation par les Larves de Paracentrotus lividus et de Sphaerechinus granularis).
W91-02047 2L

Use of Kinetic Bioassay Procedure to Estimate Sulfate and Cysteine Concentrations in Sediment.
W91-02796 2H

AMMONIA
Septic Tank and Agricultural Non-Point Source Pollution Within a Rural Watershed.
W91-02177 5B

Free Ammonia and Toxicity Criteria in a Polluted Urban Lake.
W91-02536 5B

Sediment Oxygen Demand Model: Methane and Ammonia Oxidation.
W91-02576 2H

AMMONIA REMOVAL
Large-Scale Biological Nitrate and Ammonia Removal.
W91-02843 5F

AMPHIBIANS
Protective Action of Ions against Cadmium Toxicity to Young Bufo arenarum Tadpoles.
W91-02092 5C

Artificially Induced Metamorphosis Acetone in Acris gryllus.
W91-02201 5C

Predation on Amphibian Eggs and Tadpoles by Common Predators in Acidified Lakes.
W91-02407 5C

Effects of Pool Size and Isolation on Amphibian Communities.
W91-02517 2H

AMPHIPODS
Toxicity Test Procedures for Hyalella azteca, and Chronic Toxicity of Cadmium and Pentachlorophenol to H. azteca, Gammarus fasciatus, and Daphnia magna.
W91-02444 5A

ANAEROBIC CONDITIONS
Comparative Study of the Response of Taxodium distichum and Nyssa aquatica Seedlings to Soil Anaerobiosis and Salinity.
W91-02500 2E

ANAEROBIC DIGESTION
Application of the Anaerobic Fluidized Bed Reactor for the Biological Wastewater Treatment at Low Temperatures (Anwendung des Anaeroben Fliessbettreaktors in der Biologischen Abwasserreinigung bei Niedrigen Temperaturen).
W91-02058 5D

Heavy Metal Distribution in Anaerobic Sludges.
W91-02221 5D

Interaction between Sulfate Reducers and Methanogens Fed Acetate and Propionate.
W91-02537 5D

Continuous Anaerobic Treatment of Pulping Wastewaters.
W91-02580 5D

Digester Gas is Alternate Fuel.
W91-02764 5D

Inhibitory Effect of Citrus unshu Peel on Anaerobic Digestion.
W91-02773 5D

Performances of Digesters Treating the Organic Fraction of Municipal Solid Wastes Differently Sorted.
W91-02775 5D

Effects of Chemical Phosphorus Precipitation on Anaerobic Digestion.
W91-02823 5D

ANALYTICAL METHODS
Effects of Water Acidity, Calcium, and Aluminum on Whole Body Ions of Brook Trout (Salvelinus fontinalis) Continuously Exposed from Fertilization to Swim-Up: A Study by Instrumental Neutron Activation Analysis.
W91-02104 5C

Soil Water Diffusivity Determination by a Modified One-Step Outflow Method.
W91-02140 2G

Unsaturated Hydraulic Conductivity Determined by the Hot Air Method for Some Danish Till Soils.
W91-02169 2G

Methods Used for Calculation of Plant Available Water in Nordic Till Soils.
W91-02170 2G

Methods for Assessing Fertilization and Embryonic/Larval Development in Toxicity Tests Using the California Mussel (Mytilus californianus).
W91-02212 5A

Comparison of Quarter-Hourly On-Line Dynamic Headspace Analysis to Purge-and-Trap Analysis of Varying Volatile Organic Compounds in Drinking Water Sources.
W91-02219 5A

Periphyton as Indicator of the Reservoir Water Quality: III. Biomonitoring Techniques.
W91-02382 5A

Binding of Triazine Herbicides to Antibodies in Anhydrous Organic Solvents.
W91-02512 5A

Determination of Cobalt by Adsorptive Stripping Voltammetry Using Cobalt(II)-Nioxime-Nitrite Catalytic System.
W91-02513 5A

Fast Determination of the Biodegrability of Organic Compounds in a Laboratory-Trickling-Filter (Rasche Bestimmung des Bioabbaus Organischer Stoffe in einem Labor-Tropfkorper).
W91-02544 5D

Simple Method to Distinguish Between Polyphosphate and Other Phosphate Fractions of Activated Sludge.
W91-02790 5D

ANALYTICAL TECHNIQUES
Toxicity Test for Water and Waste Water: Aldehyde Dehydrogenase Inhibition Test in Cuvets and Microtiter Plates (Toxizitaetstests fuer Wasser und Abwasser: Kuevetten- und Mikrotiterplattentest mit Aldehyddehydrogenase).
W91-02056 5A

Sorption Layers Impregnated with Ammonium Molybdate for the Thin Layer Chromatography in Order to Evaluate Phenol Contaminated Waters (Ammoniummolybdatimpaegnierte Sorptionschichten fuer die Duennschichtchromatographie zur Beurteilung Phenolkontaminierter Waesser).
W91-02059 5A

Measurement and Calculation of Dinitrogen Fixation in Water Bodies.
W91-02378 2K

Liquid Chromatography-Mass Spectrometry: An Emerging Technology for Nonvolatile Compounds.
W91-02417 5A

Pyrolysis-GC-MS for Investigating High-Molecular-Weight THM Precursors and Other Refractory Organics.
W91-02418 5F

Comparison of the Zinc Sulfate and Immunofluorescence Techniques for Detecting Giardia and Cryptosporidium.
W91-02419 5A

Assessing Defined-Substrate Technology for Meeting Monitoring Requirements of the Total Coliform Rule.
W91-02420 5A

Periphyton Ash Weight Estimation from Residue Not Digested after Hach Method of Kjeldahl Protein Nitrogen Analysis.
W91-02785 7B

Mechanism of Enrichment of Trace Metals on Fine Sludges Collected from Filtration Plants.
W91-02819 5A

ANCLOTE RIVER
Surface-Water Hydrology and Salinity of the Anclote River Estuary, Florida.
W91-02229 2E

NIMAL BEHAVIOR
Phototaxis in Daphnia magna: The Influence of Temperature and Acidity on the Phototactic Behaviour of Daphnia Genotypes.
W91-02117 2H

Avoidance of Selenium-Treated Food by Mallards.
W91-02214 5C

NIMAL FEED
Safety and Efficacy of Food Processing Sludges as Animal Feed: Chemical Characterization.
W91-02542 5E

NIMAL METABOLISM
Calcium Metabolism in Two Populations of the Snail Helix aspersa on a High Lead Diet.
W91-02205 5C

NIMAL PARASITES
Sublethal Effects of 2,2-Dichloropropionic Acid (Dalapon) on Fossaria cubensis, Intermediate Host of the Liver Fluke, Fasciola hepatica.
W91-02095 5C

NIMAL PATHOLOGY
Skeletal Deformities in Smallmouth Bass, Micropterus dolomieui, from Southern Appalachian Reservoirs.
W91-02440 5C

NIMAL TISSUES
Skeletal Deformities in Smallmouth Bass, Micropterus dolomieui, from Southern Appalachian Reservoirs.
W91-02440 5C

NISOTROPY
Simulation of Downhole and Crosshole Seismic Tests on Sand Using the Hydraulic Gradient Similitude Method.
W91-02939 7B

NNULAR FLOW
Split of Two-Phase Flow at a Horizontal T-Annular and Stratified Flow.
W91-02613 8B

NTIFOULANTS
Sublethal and Histopathological Effects of Trace Levels of Tributyltin Fluoride on Adult Oysters Crassostrea gigas.
W91-02045 5C

Tributyltin Retards Regeneration and Produces Deformities of Limbs in the Fiddler Crab, Uca pugilator.
W91-02434 5C

Differences Between Freshwater and Seawater-Acclimated Guppies in the Accumulation and Excretion of Tri-n-Butyltin Chloride and Triphenyltin Chloride.
W91-02793 5C

PPALACHIAN MOUNTAINS
Skeletal Deformities in Smallmouth Bass, Micropterus dolomieui, from Southern Appalachian Reservoirs.
W91-02440 5C

Soil Water Relations on a Hilltop Cornfield in Central Appalachia.
W91-02592 2G

QUACULTURE
Inorganic Pollution of the Man-Made Lakes of Wadi El-Raiyan and Its Impact on Aquaculture and Wildlife of the Surrounding Egyptian Desert.
W91-02462 5B

Identification and Inventory of Philippine Forested-Wetland Resource.
W91-02473 2H

AQUATIC ANIMALS
Methylparathion-Induced Alterations in the Acetylcholinesterase and Phosphatases in a Penaeid Prawn, Metapenaeus monoceros.
W91-02097 5C

Phototaxis in Daphnia magna: The Influence of Temperature and Acidity on the Phototactic Behaviour of Daphnia Genotypes.
W91-02117 2H

AQUATIC BACTERIA
Micrograzer Impact and Substrate Limitation of Bacterioplankton in Lake Michigan.
W91-02072 2H

Attached and Free-Living Dividing Bacteria in Two Aquatic Systems.
W91-02121 2H

Key Factors in Taste and Odour Problems for Municipal Water Works Using Surface Water Sources.
W91-02394 5F

AQUATIC ECOSYSTEMS
Sensitivity Analysis of Nine Diversity and Seven Similarity Indices.
W91-02534 2H

AQUATIC ENVIRONMENT
Ways of Evaluating Human-Induced Impacts on the Functioning of Waterbody Ecosystems.
W91-02397 4C

Overview of Case Studies on Recovery of Aquatic Systems from Disturbance.
W91-02898 5G

Regional Framework for Establishing Recovery Criteria.
W91-02905 2H

AQUATIC HABITATS
Application of QSARs to Predict Potential Aquatic Toxicities of Organochlorine Pesticides.
W91-02178 5C

Spatial Organization and Population Density of the Fish Community of the Litter Banks within a Central Amazonian Blackwater Stream.
W91-02414 2H

Effects of Pool Size and Isolation on Amphibian Communities.
W91-02517 2H

Asiatic Clam, Corbicula spp., as a Biological Monitor in Freshwater Environments.
W91-02944 5A

State of the Chesapeake Bay.
W91-02956 5G

AQUATIC INSECTS
Summary of Biological Investigations Relating to Surface-Water Quality in the Kentucky River Basin, Kentucky.
W91-02232 5C

Foodweb Response to the Experimental Manipulation of a Benthivore (Cyprinus carpio), Zooplanktivore (Menidia beryllina) and Benthic Insects.
W91-02453 2H

AQUATIC PLANTS
Aquatic and Certain Wetland Vascular Vegetation of Reelfoot Lake, 1920s-1980s. III. Submersed Macrophytes.
W91-02581 2H

Aquatic and Certain Wetland Vascular Vegetation of Reelfoot Lake, 1920s-1980s. IV. Seasonally Emergent Macrophytes.
W91-02582 2H

Application of a Simple Short-Term Bioassay for the Identification of Genotoxins from Hazardous Wastes.
W91-02665 5A

AQUATIC POPULATIONS
Population-Specific Toxicity Responses by the Freshwater Oligochaete, Stylodrilus heringianus, in Natural Lake Michigan Sediments.
W91-02213 5C

AQUATIC PRODUCTIVITY
Modelling Phytoplankton Productivity in Turbid Waters with Small Euphotic to Mixing Depth Ratios.
W91-02115 2H

Type of Suspended Clay Influences Lake Productivity and Phytoplankton Community Response to Phosphorus Loading.
W91-02586 2H

AQUATIC WEED CONTROL
Influence of the Herbicide Paraquat 'Gramaxon' on Growth and Metabolic Activity of Three Chlorophytes.
W91-02085 4A

AQUIA AQUIFER
Difference Between the Potentiometric Surface of the Aquia Aquifer of September 1986 and September 1988 in Southern Maryland.
W91-02255 7C

Potentiometric Surface of the Aquia Aquifer in Southern Maryland During September 1988.
W91-02257 7C

AQUIFER CHARACTERISTICS
Comparison of Darcian Flow in Corresponding Flat and Folded Surfaces.
W91-02186 2F

Hydrogeological and Geophysical Electromagnetic Study of the Alluvial Aquifer of Wadi Teloua, Agadez, Niger (Etude Hydrogeologique et Geophysique Electromagnetique de la Nappe Alluviale du Kori Teloua, Agadez, Niger).
W91-02323 2F

Study of Groundwater Resources of the Bubaque and Bolama Islands (Bissagos Islands) (Etude des Ressources en Eau Souterraine des Iles de Bubaque et Bolama (Archipel des Bijagos)).
W91-02331 2F

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 3. Estimation of Resources.
W91-02334 2F

Solution of Disseminated Calcite in Quartz Veins of Birrimien Schists in Burkina Faso as a Key to a Possible Aquifer Model.
W91-02346 2F

Geophysical Investigation--Southwestern Great Artesian Basin.
W91-02529 8E

Evaluation of Hydrogeological Parameters in Heterogeneous Porous Media.
W91-02673 2F

Indicator Conditional Simulation of the Architecture of Hydraulic Conductivity Fields: Application to a Sand-Shale Sequence.
W91-02676 2F

Distribution of Aquifer Recharge from a Circular Spreading Basin under Transient Operations.
W91-02678 4B

LIBRARY U. S. GEOLOGICAL SURVEY

AQUIFER CHARACTERISTICS

Estimation of the Transmissivity of the Santiago Aquifer, Chile, Using Different Geostatistical Methods.
W91-02679 2F

AQUIFER MANAGEMENT

Groundwater Management: Quantity and Quality.
W91-02672 4B

Distribution of Aquifer Recharge from a Circular Spreading Basin under Transient Operations.
W91-02678 4B

Aquifers as Components of Water Resources Systems.
W91-02709 4B

Waste Water, Infiltration-Percolation for Aquifer Recharge or Water Re-use.
W91-02710 5D

Regionalization Schemes for the Management of Large Water Resources Systems.
W91-02711 4B

Harvest of Ephemeral Runoff for Artificial Groundwater Recharge: Feasibility Evaluation using Hydrological and Hydrogeochemical Models.
W91-02712 3B

Groundwater Management Strategy for Salinity Mitigation in the Victorian Riverine Plain, Australia.
W91-02713 3C

Role of Groundwater in Israel's Integrated Water System.
W91-02714 4B

Artificial Recharge Pilot Projects in Gujarat, India.
W91-02717 4B

Madrid Miocene Aquifer as a Component of the Metropolitan Water Supply System.
W91-02718 4B

Application of Groundwater Modelling in Water Resources Management in Denmark.
W91-02719 5B

Feasibility Study on the Groundwater Development for the Water Supply of an Oil Shale Processing Plant in Central Jordan.
W91-02720 4B

Alluvial Aquifer of the Grand Gravier (Rhone Valley, France) Modelling and Protection.
W91-02721 5G

Wetlands and Groundwater: New Constraints in Groundwater Management.
W91-02722 6G

Gravel Extraction and Water Resources Management of the Denge Gravel Aquifer, Kent, England.
W91-02723 4C

Groundwater Flow and Quality Studies in Szigetkoz Region, Northwest Hungary.
W91-02724 6G

Hydrogeological Approach to Investigation in Karst for Possible Modification of Groundwater Regime and Increase of Recoverable Reserves.
W91-02820 4B

AQUIFER SYSTEMS

Water-Quality Characteristics of the Columbia Plateau Regional Aquifer System in Parts of Washington, Oregon, and Idaho.
W91-02223 2F

Geophysical Investigation--Southwestern Great Artesian Basin.
W91-02529 8E

AQUIFER TESTING

Exploration of Karstified Joints in Precambrian Limestone Aquifers of the Gondo Plain (Mali) with Electromagnetic Horizontal-Loop Methods (Localisation des Fractures Karstifiees des Calcaires Precambbriens dans la Plaine du Gondo (Mali) par la Prospection Electromagnetique Bipole).
W91-02321 2F

Electric Method in Village Hydraulic Projects in Benin: The Case of Crystalline Formations (Granite-Sandstone) (La Methode Electrique en Hydraulique Villageoise: Cas des Formations Cristallines (Granite-Gneiss)).
W91-02322 2F

Evaluation of Hydrogeological Parameters in Heterogeneous Porous Media.
W91-02673 2F

AQUIFERS

Response of the Water Level in a Well to Earth Tides and Atmospheric Loading Under Unconfined Conditions.
W91-02188 2F

Altitude of Potentiometric Surface, Fall 1985, and Historic Water-Level Changes in the Memphis Aquifer in Western Tennessee.
W91-02224 2F

Geology and Ground-Water Resources of the Cockfield Formation in Western Tennessee.
W91-02225 2F

Use of Oxygen-18 and Deuterium Mass-Balance Analysis to Evaluate Induced Recharge to Stratified-Drift Aquifers.
W91-02287 2F

Water Transfer in Porous Non-Saturated Rock and Aquifer Recharge in the Sudano-Sahelian Climate (Transfert d'Eau en Milieu Poreux non Sature Recharge des Nappes en Climat Soudano-Sahelien).
W91-02319 2F

Exploration of Karstified Joints in Precambrian Limestone Aquifers of the Gondo Plain (Mali) with Electromagnetic Horizontal-Loop Methods (Localisation des Fractures Karstifiees des Calcaires Precambbriens dans la Plaine du Gondo (Mali) par la Prospection Electromagnetique Bipole).
W91-02321 2F

Electric Method in Village Hydraulic Projects in Benin: The Case of Crystalline Formations (Granite-Sandstone) (La Methode Electrique en Hydraulique Villageoise: Cas des Formations Cristallines (Granite-Gneiss)).
W91-02322 2F

Hydrogeological and Geophysical Electromagnetic Study of the Alluvial Aquifer of Wadi Teloua, Agadez, Niger (Etude Hydrogeologique et Geophysique Electromagnetique de la Nappe Alluviale du Kori Teloua, Agadez, Niger).
W91-02323 2F

Prospecting for Aquifer Fractures in the Crystalline Basement by Soil Radon Analysis (Prospection des Fractures Aquiferes du Socle Cristallin par Dosage du Gaz Radon Contenu dans le Sol).
W91-02324 2F

Geophysical Prospecting for Ground Water Exploration in Discontinuous Aquifers for Rural Water Supply Projects in the Sahel.
W91-02325 2F

New Instruments for Electrical and Audiomagnetotelluric Prospecting (Caracteristiques des Equipements Modernes de Prospection Geophysique par Methods Electrique ou Audiomagnetotellurique).
W91-02326 7B

Geophysical Methodology Applied to Rural Water Supply in Bedrock Environment: Preliminary Results (Methodologie Geophysique Appliquee a l'Hydraulique Villageoise en Zone de Socle: Resultats Preliminaires).
W91-02328 2F

Aquifer Characteristics in the Sedimentary Basins of the Semi-Arid and Arid Areas of Kenya.
W91-02329 2F

Hydrogeological Role of the Faults in the Valleys of the South of Air (Republic of Niger) (Sur les Roles Hydrogeologiques des Failles dans les Vallees du Sud d'Air (Republique du Niger)).
W91-02341 2F

Microbial Colonization of Aquifer Sediment Exposed in a Groundwater Well in Northern Germany.
W91-02767 2F

Hydrogeological Approach to Investigation in Karst for Possible Modification of Groundwater Regime and Increase of Recoverable Reserves.
W91-02820 4B

Aquifer Thermal Energy Storage: A Numerical Simulation of Field Experiments in China.
W91-02866 4B

Stochastic Analysis of the Concentration Variability in a Three-Dimensional Heterogeneous Aquifer.
W91-02884 2F

Contaminant Migration Through Fractured Till into an Underlying Aquifer.
W91-02941 5B

ARABIAN GULF

Oil Pollution in the Southern Arabian Gulf and Gulf of Oman.
W91-02559 5B

ARCH DAMS

Sir Dam and Powerplant.
W91-02112 8A

ARCTIC OCEAN

Distribution of Shrimp and Fish By-Catch Assemblages in the Canadian Eastern Arctic in Relation in Water Circulation.
W91-02066 2L

ARCTIC ZONE

Glaciomarine Sedimentation in Disraeli Fjiord, High Arctic Canada.
W91-02929 2J

ARID LANDS

State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa.
W91-02288 2A

General Characteristics of Surface Hydrology in Arid and Semi-arid Areas of Africa and Their Consequences for Development (Caracteres Generaux de l'Hydrologie Superficielle des Zones Arides et Semi-Arides en Afrique: Leurs Consequences sur les Etudes des Ingenieurs).
W91-02290 2E

Hydrological Modelling for Water Management in Arid and Semi-arid Areas of Africa.
W91-02291 2A

CIEH's Contribution to the Development of Hydrology in Arid and Semi-Arid Areas in Africa (Contribution du CIEH au Developpe-

ment de l'Hydrologie dans les Zones Arides et Semi-arides d'Afrique).
W91-02292 2A

Towards a Regional Water Resource Study of Arid and Semi-arid Africa.
W91-02295 2A

Impact of Soil Surface Deterioration on Runoff Production in the Arid and Semi-arid Zones of West Africa.
W91-02296 4C

Surface Features: One of the Key Elements of Sahelian Hydrology (Les Etats de Surface: Une des Clefs de l'Hydrologie Sahelienne).
W91-02297 2A

Water Losses in the Nile Basin.
W91-02298 2A

Analysis of Drought in Ethiopia Based on Nile River Flow Records.
W91-02299 2A

Evaporation from Free Water Surfaces in the Sudano-Sahelian Climate (L'evaporation des nappes d'eau libre en climat soudano-sahelien).
W91-02300 2D

Fractal Approach to Spatial Variability of West African Rainfall Events (Approche Fractale de la Variabilite Spatiale des Episodes Pluvieux de l'Afrique de l'Ouest).
W91-02301 2B

Analysis of Non-Stationarity of West African Rainfall and Hydrological Series (Analyse de la Non Stationnarite des Series Pluviometriques et Hydrologiques d'Afrique de l'Ouest).
W91-02302 2B

Review of Water Resources Investigation and Development Using Satellite Remotely Sensed Data of the Nazinga Game Area, Burkina Faso.
W91-02304 7B

Predetermination of Floods in Small Sahelian Basins under 10 Square Kilometers (La Predeterminatione des Crues sur des Petits Bassins Saheliens Inferieurs a 10 km2).
W91-02305 2E

Use of the Gould Probability Matrix Method of Reservoir Design in Arid and Semi-Arid Regions.
W91-02306 8A

Interflux Dams: Their Advantage for Saharan and Sahelian Africa (Les Barrages d'Inferoflux: Leur Interet pour l'Afrique Saharienne et Sahelienne).
W91-02313 8A

Hydrologic Regime under Natural Climatic Conditions in the Lateritic Soil of Burkina Faso (Regime Hydrique en Conditions Climatiques Naturelles d'un Sol Lateritique du Burkina Faso).
W91-02317 2G

Natural Groundwater Recharge Estimation in (Semi-)Arid Zones: Some State-of-the-Art Observations.
W91-02318 2F

Water Transfer in Porous Non-Saturated Rock and Aquifer Recharge in the Sudano-Sahelian Climate (Transfert d'Eau en Milieu Poreux non Nature Recharge des Nappes en Climat Soudano-Sahelien).
W91-02319 2F

Investigation of Groundwater Recharge Mechanisms in Burkina Faso.
W91-02320 2F

Hydrology and River Control on the Niger and Senegal.
W91-02358 2E

Water Assessment of Soils and Traditional Agricultural Calendars in Upper Borgou (Rep. Pop. du Benin) (Bilans d'Eau des Sols et Calendriers Agricoles Traditionnels dans le Haut Borgou (R.P. Benin)).
W91-02367 3F

ARID-ZONE HYDROLOGY

State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa.
W91-02288 2A

ARIZONA

Estimates of Ground-Water Flow Components for Lyman Lake, Apache County, Arizona, with a Section on Geochemistry of Surface Water and Ground Water in the Lyman Lake Area by Fredrick N. Robertson.
W91-02231 2F

Salt River Pima-Maricopa Indian Community Water Rights Settlement Act of 1988.
W91-02271 6E

Southwestern Riparian Plant Communities: Site Characteristics, Tree Species Distributions, and Size-class Structures.
W91-02491 2H

Possible Effects of Residential Development on Streamflow, Riparian Plant Communities, and Fisheries on Small Mountain Streams in Central Arizona.
W91-02493 4C

Agricultural Water Use Monitoring Through Landsat Surveillance.
W91-02600 3F

Superfund Record of Decision: Motorola (52nd Street Plant), AZ. First Remedial Action.
W91-02652 5G

ARKANSAS

Ground-Water Levels in Arkansas, Spring 1990.
W91-02250 7C

Water Resources Data for Arkansas, Water Year 1989.
W91-02261 7C

ARMORED SLOPES

Estimation of Flow through and over Armored Slopes.
W91-02526 5E

AROMATIC COMPOUNDS

Biodegradability of Mono- and Disubstituted Benzene-Derivatives (Zur Biologischen Abbaubarkeit Mono- und Disubstituierter Benzolderivate).
W91-02055 5D

ARSENIC

Speciation and Behavior of Arsenic in the Nile Delta Lakes.
W91-02087 5B

Selective Adsorption of Arsenic(V) Ion by Use of Iron(III) Hydroxide-Loaded Coral Limestone.
W91-02220 5D

ARTESIAN AQUIFERS

Difference Between the Potentiometric Surface of the Aquia Aquifer of September 1986 and September 1988 in Southern Maryland.
W91-02255 7C

Difference Between the Potentiometric Surface of the Magothy Aquifer of September 1986 and September 1988 in Southern Maryland.
W91-02256 7C

Potentiometric Surface of the Aquia Aquifer in Southern Maryland During September 1988.
W91-02257 7C

ARTIFICIAL INTELLIGENCE

Interactive Groundwater Modelling: Colour Graphics, ICAD and AI.
W91-02699 2F

ARTIFICIAL LAKES

Influence of Cage Rearing Pisciculture on Water Quality and Bottom Sediments in Artificial Lakes.
W91-02393 5C

ARTIFICIAL RECHARGE

Artificial Recharge in the Angas-Bremer Irrigation Area.
W91-02530 4B

Hydrogeochemical and Isotopical Investigations of Ground and Surfacewaters at the Southwest Edge of the Harzmountains during an Artificial Induced High Water (Hydrogeochemische und Isotopenchemische Untersuchungen an Grund und Oberflachenwassern am Sudwestrand des Harzes Wahrend eines Kunstlich Induzierten Hochwassers).
W91-02545 2K

Distribution of Aquifer Recharge from a Circular Spreading Basin under Transient Operations.
W91-02678 4B

Modelling of Flow and Contaminant Transport in a Conjunctively Managed Groundwater Basin: A Case Study.
W91-02707 5B

Harvest of Ephemeral Runoff for Artificial Groundwater Recharge: Feasibility Evaluation using Hydrological and Hydrogeochemical Models.
W91-02712 3B

Artificial Recharge Pilot Projects in Gujarat, India.
W91-02717 4B

ARTIFICIAL WETLANDS

Laboratory Mesocosm Studies of Fe, Al, Mn, Ca, and Mg Dynamics in Wetlands Exposed to Synthetic Acid Coal Mine Drainage.
W91-02091 5D

Wetland Areas: Natural Water Treatment System (Jan 78 - Aug 89). Citations from the Pollution Abstracts Database.
W91-02642 5D

ASBESTOS

Cost Supplement to Technologies and Costs for the Removal of Asbestos from Potable Water Supplies.
W91-02730 5F

ASSESSMENTS

Proposed Framework and Database for EIA Auditing.
W91-02950 7B

ATMOSPHERIC CHEMISTRY

Seasonal Dynamics in Methane Emissions from the Amazon River Floodplain to the Troposphere.
W91-02834 2H

Methane Flux from the Amazon River Floodplain: Emissions During Rising Water.
W91-02837 2H

Sources and Sinks of Formic, Acetic, and Pyruvic Acids Over Central Amazonia. 2. Wet Season.
W91-02838 5B

Atmospheric Sulfur Cycle Over the Amazon Basin. 2. Wet Season.
W91-02839 5B

ATMOSPHERIC CIRCULATION
Sensitivity of the Surface Hydrology to the Complexity of the Land-surface Parameterization Scheme Employed.
W91-02804 7C

Some Observational Evidence on the Effect of Atmospheric Forcing on Tidal Variability in the Upper Delaware Bay.
W91-02833 2L

ATMOSPHERIC PHYSICS
Physics of Supercooling of Thin Water Skins Covering Gyrating Hailstones.
W91-02119 2C

Tropical Squall Line Observed During the COPT 81 Experiment in West Africa. Part III: Heat and Moisture Budgets.
W91-02761 2B

ATMOSPHERIC PRESSURE
Response of the Water Level in a Well to Earth Tides and Atmospheric Loading Under Unconfined Conditions.
W91-02188 2F

ATMOSPHERIC WATER
Tropical Squall Line Observed During the COPT 81 Experiment in West Africa. Part III: Heat and Moisture Budgets.
W91-02761 2B

Biosphere and Climate.
W91-02803 2A

ATOMIC ABSORPTION SPECTROPHOTOMETRY
Preconcentration of Copper on Algae and Determination by Slurry Graphite Furnace Atomic Absorption Spectrometry.
W91-02191 5A

ATRAZINE
Effects of Atrazine on Freshwater Microbial Communities.
W91-02202 5C

AUDITING
Proposed Framework and Database for EIA Auditing.
W91-02950 7B

AUSTRALIA
Factors Influencing Community Structure and Distribution of Different Life-Cycle Categories of Fishes in Shallow Waters of a Large Australian Estuary.
W91-02123 2L

Geophysical Investigation--Southwestern Great Artesian Basin.
W91-02529 8E

Coongie Lakes Control Zone--A Map and Note for the Surface Geology and Terrain.
W91-02531 2H

Water Research in Australia: Current Projects 1989.
W91-02612 9D

Controls and Effects of Continental Brine Formation in a Supratidal Ephemeral Lake in the Semi-arid Environment of Spencer Gulf, South Australia.
W91-02806 2H

Climatic Influences on Streamflow Variability: A Comparison Between Southeastern Australia and Southeastern United States of America.
W91-02877 2B

Proposed Framework and Database for EIA Auditing.
W91-02950 7B

Health Effects of Chemical Waste in an Urban Community.
W91-02952 5C

AUTOMATION
Computer-Controlled Well Field and Distribution System.
W91-02427 5F

Using Programmable Logic Controllers.
W91-02566 5D

Computer-Controlled 36-Channel Time Domain Reflectometry System for Monitoring Soil Water Contents.
W91-02861 2G

Computer-Controlled Automated Rain Sampler (CCARS) for Rainfall Measurement and Sequential Sampling.
W91-02914 7B

AZO DYES
Analytical Properties of 4,4'-Biazobenzenediazoaminobenzene and Its Applications in Spectrophotometry.
W91-02548 5A

BACTERIA
Measuring Epilithic Bacterial Production in Streams.
W91-02070 2H

Micrograzer Impact and Substrate Limitation of Bacterioplankton in Lake Michigan.
W91-02072 2H

Water Quality of Some Reservoirs.
W91-02391 5A

Filtration/Adsorption Media for Bacteria and Turbidity Removal.
W91-02579 5F

Planktonic Community Structure Determines the Fate of Bacterial Production in a Temperate Lake.
W91-02585 2H

Biodegradation of p-Nitrophenol in an Aqueous Waste Stream by Immobilized Bacteria.
W91-02768 5D

EC Bathing Waters Directive as Applied to Scotland.
W91-02848 5G

BACTERIAL ANALYSIS
Characterization of Bacterial Biomass Potential Activity by Proteolytic Activity Measurements.
W91-02830 5D

BACTERIAL PHYSIOLOGY
Attached and Free-Living Dividing Bacteria in Two Aquatic Systems.
W91-02121 2H

Remobilization of Toxic Heavy Metals Adsorbed to Bacterial Wall-Clay Composites.
W91-02771 5B

BACTERIOPHAGE
Simple Membrane Filter Method to Concentrate and Enumerate Male-Specific RNA Coliphages.
W91-02416 5A

Application of Direct Plaque Assay for Detection and Enumeration of Bacteriophages of Bacteroides fragilis from Contaminated-Water Samples.
W91-02770 5A

Inactivation of Bacteriophage MS2 in Wastewater Effluent with Monochromatic and Polychromatic Ultraviolet Light.
W91-02795 5D

BAHRAIN
Trace Metal Analysis of Sewage Sludge and Soils in Bahrain.
W91-02088 5E

BAJA CALIFORNIA
Geographic Distribution and Climatic Variation of the Pluvial Regimes in Baja California Sur, Mexico (Distribucion Geografica y Variabilidad Climatica de los Regimenes Pluviometricos en Baja California Sur, Mexico).
W91-02805 2B

BALDCYPRESS TREES
Growth and Development of Bald-Cypress/Water-Tupelo Stands under Continuous Versus Seasonal Flooding.
W91-02499 2E

Long-Term Trends in the Bald-Cypress (Taxodium distichum) Resource in Louisiana (U.S.A).
W91-02501 2H

BALTIC SEA
Fucus vesiculosus as an Indicator of Heavy Metal Availability in a Fish Farm Recipient in the Northern Baltic Sea.
W91-02560 5A

Recent Investigation of Total Carbonate in the Baltic Sea: Changes from the Past as a Result of Acid Rain.
W91-02853 5B

BARIUM
Barium Bioaccumulation in Clams Collected from Different Salinity Regimes along the Saudi Coast of the Arabian Gulf.
W91-02094 5B

BAROTROPIC MODELS
Withdrawal of Shelf Water into an Estuary: A Barotropic Model.
W91-02831 2L

BARRA BONITA RESERVOIR
Limnology and Eutrophication of Barra Bonita Reservoir, S. Paulo State, Southern Brazil.
W91-02371 2H

BARRIERS
Changes in Seasonal Succession of Phytoplankton Induced by the Storm-Surge Barrier in the Oosterschelde (S.W. Netherlands).
W91-02116 2L

BASELINE STUDIES
Gamma Emitters in Hong Kong Water.
W91-02816 5B

BASS
Survival of Striped Bass Larvae and Yearlings in Relation to Contaminants and Water Quality in the Upper Chesapeake Bay.
W91-02194 5C

S-Oxygenation of Thiobencarb (Bolero) in Hepatic Preparations from Striped Bass (Morone saxatilis) and Mammalian systems.
W91-02552 5C

BATHYMETRY
Fathometer Data from Bart Lake and Lake Dorothy Near Juneau, Alaska, 1988-89.
W91-02254 7C

BEACH PROFILES
Laboratory Investigation of Beach Profiles in Tailings Disposal.
W91-02919 5E

LIBRARY U. S. ENVIRONMENTAL

BED LOAD
Bed Configurations in Steady Unidirectional Water Flows: Part 1. Scale Model Study Using Fine Sands.
W91-02925 2E

Bed Configurations in Steady Unidirectional Water Flows: Part III. Effects of Temperature and Gravity.
W91-02927 2E

BEDROCK
Migration of Pollutants in Groundwater: IV. Modeling of the Pumping of Contaminants from Fractured Bedrock.
W91-02945 2F

BENEFITS
Design and Management of Rural Water Supply Projects: Lessons Learned from Comparative Study of USAID Projects in Burkina Faso and Togo.
W91-02362 5F

BENIN
Utilization of the ARGOS System Within the Framework of the Hydrometric Network of Benin (L'Utilisation du Systeme ARGOS dans le Cadre du Reseau Hydrometrique Beninois).
W91-02340 7B

Water Assessment of Soils and Traditional Agricultural Calendars in Upper Borgou (Rep. Pop. du Benin) (Bilans d'Eau des Sols et Calendriers Agricoles Traditionnels dans le Haut Borgou (R.P. Benin)).
W91-02367 3F

BENTHIC ENVIRONMENT
Macrobenthic Population of the Port of Algiers (Les Peuplements Macro Benthiques du Port d'Alger).
W91-02054 5B

DDT Contamination of Benthic Macroinvertebrates and Sediments from Tributaries of Wheeler Reservoir, Alabama.
W91-02442 5B

BENTHIC FAUNA
DDT Contamination of Benthic Macroinvertebrates and Sediments from Tributaries of Wheeler Reservoir, Alabama.
W91-02442 5B

BENTHOS
Foodweb Response to the Experimental Manipulation of a Benthivore (Cyprinus carpio), Zooplanktivore (Menidia beryllina) and Benthic Insects.
W91-02453 2H

Revision of the Saprobic System (Eine Revision des Saprobiensystems).
W91-02546 5G

BENZENE
Biodegradability of Mono- and Disubstituted Benzene-Derivatives (Zur Biologischen Abbaubarkeit Mono- und Disubstituierter Benzolderivate).
W91-02055 5D

Subclinical Effects of Groundwater Contaminants. II. Alteration of Regional Brain Monoamine Neurotransmitters by Benzene in CD-1 Mice.
W91-02469 5C

BENZENES
Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: I. 1,2,4-Trichlorobenzene.
W91-02436 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: II. 1,3,5-Trichlorobenzene.
W91-02437 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: III. 1,2,3-Trichlorobenzene.
W91-02438 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: IV. Pentachlorobenzene and Comparison with Trichlorobenzene Isomers.
W91-02439 5C

Transformation of Monoaromatic Hydrocarbons to Organic Acids in Anoxic Groundwater Environment.
W91-02818 5B

BIBLIOGRAPHIES
Bibliography of U.S. Geological Survey Reports on the Water Resources of Florida, 1886-1989.
W91-02237 10C

Water Research in Australia: Current Projects 1989.

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: I. 1,2,4-Trichlorobenzene.
W91-02436 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: II. 1,3,5-Trichlorobenzene.
W91-02437 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: III. 1,2,3-Trichlorobenzene.
W91-02438 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: IV. Pentachlorobenzene and Comparison with Trichlorobenzene Isomers.
W91-02439 5C

Tigris-Euphrates Delta: A Major Source of Pesticides to the Shatt al-Arab River (Iraq).
W91-02463 5B

Polychlorinated Biphenyl Congeners in Sediments, Plankton, Molluscs, Crustaceans, and Eel in a Freshwater Lake: Implications of Using Reference Chemicals and Indicator Organisms in Bioaccumulation Studies.
W91-02465 5B

Differences Between Freshwater and Seawater-Acclimated Guppies in the Accumulation and Excretion of Tri-n-Butyltin Chloride and Triphenyltin Chloride.
W91-02793 5C

Accumulation from Water and Depuration of 110mAg by a Freshwater Fish, Salmo trutta L.
W91-02798 5B

Asiatic Clam, Corbicula spp., as a Biological Monitor in Freshwater Environments.
W91-02944 5A

BIOASSAY
Short-Term Lethality and Sediment Avoidance Assays with Endrin-Contaminated Sediment and Two Oligochaetes from Lake Michigan.
W91-02199 5C

Effects of Atrazine on Freshwater Microbial Communities.
W91-02202 5C

Assessing Detoxification of a Complex Hazardous Waste, Using the Microtox Bioassay.
W91-02204 5E

Methods for Assessing Fertilization and Embryonic/Larval Development in Toxicity Tests Using the California Mussel (Mytilus californianus).
W91-02212 5A

Population-Specific Toxicity Responses by the Freshwater Oligochaete, Stylodrilus heringianus, in Natural Lake Michigan Sediments.
W91-02213 5C

BIOASSAY

Periphyton as Indicator of the Reservoir Water Quality: III. Biomonitoring Techniques.
W91-02382 5A

Water Quality of Some Reservoirs.
W91-02391 5A

Acute Toxicity of Aqueous and Substrate-Bound Copper to the Midge, Chironomus decorus.
W91-02430 5C

Toxicity of Chlorinated Bornane (Toxaphene) Residues Isolated from Great Lakes Lake Trout (Salvelinus namaycush).
W91-02435 5C

Long-Term Monitoring of Polychlorinated Biphenyls in the Hudson River (New York) Using Caddisfly Larvae and Other Macroinvertebrates.
W91-02464 5B

Application of a Simple Short-Term Bioassay for the Identification of Genotoxins from Hazardous Wastes.
W91-02665 5A

Application of Direct Plaque Assay for Detection and Enumeration of Bacteriophages of Bacteroides fragilis from Contaminated-Water Samples.
W91-02770 5A

Differences Between Freshwater and Seawater-Acclimated Guppies in the Accumulation and Excretion of Tri-n-Butyltin Chloride and Triphenyltin Chloride.
W91-02793 5C

Use of Kinetic Bioassay Procedure to Estimate Sulfate and Cysteine Concentrations in Sediment.
W91-02796 2H

Monitoring and Assessment of Mercury Pollution in the Vicinity of a Chloralkali Plant: I. Distribution, Availability and Genotoxicity of Sediment Mercury in the Rushikulya Estuary, India.
W91-02932 5B

BIOAVAILABILITY

Monthly Variations of Dissolved Free Amino Acids (DFAA) Observed in the Bay of Villefranche-sur-Mer, France: Experimental Study on Their Uptake by Paracentrotus lividus and Sphaerechinus granularis Larvae (Variations Mensuelles des Acides Amines Libres Dissous (AALD) Presents en un Point de la rade de Villefranche-sur-Mer: Utilisation par les Larves de Paracentrotus lividus et de Sphaerechinus granularis).
W91-02047 2L

Effect of Solid-Phase Speciation on Metal Mobility and Phytoavailability in Sludge-Amended Soil.
W91-02089 5E

Integrated Chemical and Biological Study of the Bioavailability of Metals in Sediments from Two Contaminated Harbours in New Brunswick, Canada.
W91-02931 5B

Monitoring and Assessment of Mercury Pollution in the Vicinity of a Chloralkali Plant: I. Distribution, Availability and Genotoxicity of Sediment Mercury in the Rushikulya Estuary, India.
W91-02932 5B

BIOCHEMISTRY

Production of Dissolved DNA, RNA, and Protein by Microbial Populations in a Florida Reservoir.
W91-02766 2H

Degradation of Vinyl Acetate by Soil, Sewage, Sludge, and the Newly Isolated Aerobic Bacterium V2.
W91-02769 5D

BIOCONCENTRATION

Differences Between Freshwater and Seawater-Acclimated Guppies in the Accumulation and Excretion of Tri-n-Butyltin Chloride and Triphenyltin Chloride.
W91-02793 5C

BIODEGRADATION

Biodegradability of Mono- and Disubstituted Benzene-Derivatives (Zur Biologischen Abbaubarkeit Mono- und Disubstituierter Benzolderivate).
W91-02055 5D

MESIP: Modelling Environmental Scenarios in Ponds.
W91-02176 7C

Modeling of Multicomponent Transport with Microbial Transformation in Groundwater: The Fuhrberg Case.
W91-02180 5B

Detection of Organophosphorus Pesticide Detoxifying Bacterial Colonies, Using UV-Photography of Parathion-Impregnated Filters.
W91-02200 5B

Degradation of Pesticide Waste Taken from a Highly Contaminated Soil Evaporation Pit in California.
W91-02443 5G

Batch Biodegradation of Industrial Organic Compounds Using Mixed Liquor from Different POTWs.
W91-02540 5D

Fast Determination of the Biodegrability of Organic Compounds in a Laboratory-Trickling-Filter (Rasche Bestimmung des Bioabbaus Organischer Stoffe in einem Labor-Tropfkorper).
W91-02544 5D

Biodegradation of Toxic Organics: Status and Potential.
W91-02568 5D

In-Situ Aquifer Restoration of Chlorinated Aliphatics by Methanotrophic Bacteria.
W91-02650 5G

Biodegradation of p-Nitrophenol in an Aqueous Waste Stream by Immobilized Bacteria.
W91-02768 5D

Degradation of Vinyl Acetate by Soil, Sewage, Sludge, and the Newly Isolated Aerobic Bacterium V2.
W91-02769 5D

Some Observations on Organic Removal in an SBR.
W91-02774 5D

Transformation of Monoaromatic Hydrocarbons to Organic Acids in Anoxic Groundwater Environment.
W91-02818 5B

Degradation of Blue Green Alga, Microcystis Aeruginosa by Flagellata, Monas Guttula.
W91-02826 5F

Carbon Columns vs. the PACT Process for Priority-Pollutant Removal.
W91-02958 5D

BIOFILM REACTORS

Denitrification by an Expanded Bed Biofilm Reactor.
W91-02539 5D

Simple Solutions for Steady-State Biofilm Reactors.
W91-02569 5D

BIOFILMS

Stimulation of Biologically Active Zones (BAZ's) in Porous Media by Electron-Acceptor Injection.
W91-02161 5G

Transformation Kinetics of Trace-Level Halogenated Organic Contaminants in a Biologically Active Zone (BAZ) Induced by Nitrate Injection.
W91-02162 5G

BIOFOULING

Total Trihalomethane Formation During Targeted and Conventional Chlorination of Seawater for Biofouling Control.
W91-02538 5F

BIOGEOCHEMISTRY

Biogeochemical Cycling Constraints on Stream Ecosystem Recovery.
W91-02906 2H

BIOGEOGRAPHY

Island Biogeographical Theory: Can It Be Used to Predict Lotic Recovery Rates.
W91-02910 2E

BIOINDICATORS

Evaluation of the Sea Urchin Echinometra Iucunter as an Indicator of Heavy-Metal Contamination in Cuba (Evaluacion del Erizo de Mar Echinometra Iucunter como Indicator de Contaminacion por Metales Pesados, Cuba).
W91-02044 5A

Effects of Heavy Metals on Eels, Anguilla sp
W91-02046 5C

Response and Recovery of Brain Acetylcholinesterase Activity in Atlantic Salmon (Salmo salar) Exposed to Fenitrothion.
W91-02061 5A

Uptake of Cadmium and Nickel in Banana Prawn (Penaeus merguiensis de Man).
W91-02093 5E

Toxicity Evaluation of the Proposed Secondary and the Primary Effluents Discharged to Massachusetts Bay.
W91-02101 5E

Short-Term Exposure of Zooplankton to the Synthetic Pyrethroid, Fenvalerate, and Its Effects on Rates of Filtration and Assimilation of the Alga, Chlamydomonas reinhardii.
W91-02195 5C

Artificially Induced Metamorphosis Acetone in Acris gryllus.
W91-02201 5C

Effects of Atrazine on Freshwater Microbial Communities.
W91-02202 5C

Responses of Zooplankton and Chaoborus to Temephos in a Natural Pond and in the Laboratory.
W91-02203 5C

Methods for Assessing Fertilization and Embryonic/Larval Development in Toxicity Test Using the California Mussel (Mytilus californianus).
W91-02212 5A

Population-Specific Toxicity Responses by the Freshwater Oligochaete, Stylodrilus heringianus, in Natural Lake Michigan Sediments
W91-02213 5C

Summary of Biological Investigations Relating to Surface-Water Quality in the Kentucky River Basin, Kentucky.
W91-02232 5C

Use of the Index of Biotic Integrity to Assess the Impact of Land Management Activities on Low Order Streams in Northern Idaho.
W91-02242 5G

Periphyton as Indicator of the Reservoir Water Quality: III. Biomonitoring Techniques.
W91-02382 5A

Classification of Some Reservoirs in SR Serbia (SFR Yugoslavia) Based on Analysis of Plankton Species as Indicators of Trophic Conditions.
W91-02388 2H

Simple Membrane Filter Method to Concentrate and Enumerate Male-Specific RNA Coliphages.
W91-02416 5A

Toxicity Test Procedures for Hyalella azteca, and Chronic Toxicity of Cadmium and Pentachlorophenol to H. azteca, Gammarus fasciatus, and Daphnia magna.
W91-02444 5A

Acute Toxicity of Industrial Surfactants to Mysidopsis bahia.
W91-02445 5C

Long-Term Monitoring of Polychlorinated Biphenyls in the Hudson River (New York) Using Caddisfly Larvae and Other Macroinvertebrates.
W91-02464 5B

Revision of the Saprobic System (Eine Revision des Saprobiensystems).
W91-02546 5G

Fucus vesiculosus as an Indicator of Heavy Metal Availability in a Fish Farm Recipient in the Northern Baltic Sea.
W91-02560 5A

Application of a Simple Short-Term Bioassay for the Identification of Genotoxins from Hazardous Wastes.
W91-02665 5A

Comparative Survey of Imposex in Northeast Pacific Neogastropods (Prosobranchia) Related to Tributyltin Contamination, and Choice of a Suitable Bioindicator.
W91-02894 5A

Indicators of Ecosystem Recovery.
W91-02896 5G

Asiatic Clam, Corbicula spp., as a Biological Monitor in Freshwater Environments.
W91-02944 5A

Impact of Distillery Effluent Application to Land on Soil Microflora.
W91-02946 5C

BIOLOGICAL COMMUNITIES

Summary of Biological Investigations Relating to Surface-Water Quality in the Kentucky River Basin, Kentucky.
W91-02232 5C

BIOLOGICAL MAGNIFICATION

Acute Toxicity of Aqueous and Substrate-Bound Copper to the Midge, Chironomus decorus.
W91-02430 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: I. 1,2,4-Trichlorobenzene.
W91-02436 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: II. 1,3,5-Trichlorobenzene.
W91-02437 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: III. 1,2,3-Trichlorobenzene.
W91-02438 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: IV. Pentachlorobenzene and Comparison with Trichlorobenzene Isomers.
W91-02439 5C

Polychlorinated Biphenyl Congeners in Sediments, Plankton, Molluscs, Crustaceans, and Eel in a Freshwater Lake: Implications of Using Reference Chemicals and Indicator Organisms in Bioaccumulation Studies.
W91-02465 5B

Spatial Differences and Temporal Trends of Organochlorine Compounds in Biota from the Northwestern Hemisphere.
W91-02467 5B

BIOLOGICAL REACTORS

Simple Solutions for Steady-State Biofilm Reactors.
W91-02569 5D

BIOLOGICAL TREATMENT

Biodegradation of Toxic Organics: Status and Potential.
W91-02568 5D

In-Situ Aquifer Restoration of Chlorinated Aliphatics by Methanotrophic Bacteria.
W91-02650 5G

Large-Scale Biological Nitrate and Ammonia Removal.
W91-02843 5F

BIOLOGICAL WASTEWATER TREATMENT

Application of the Anaerobic Fluidized Bed Reactor for the Biological Wastewater Treatment at Low Temperatures (Anwendung des Anaeroben Fliessbettreaktors in der Biologischen Abwasserreinigung bei Niedrigen Temperaturen).
W91-02058 5D

Batch Biodegradation of Industrial Organic Compounds Using Mixed Liquor from Different POTWs.
W91-02540 5D

Pulping Effluents: Biological Treatment (Jan 76 - Sep 89). Citations from the Paper & Board, Printing & Packaging Industries Research Association.
W91-02645 5D

Effects of Chemical Phosphorus Precipitation on Anaerobic Digestion.
W91-02823 5D

Degradation of Blue Green Alga, Microcystis Aeruginosa by Flagellata, Monas Guttula.
W91-02826 5F

BIOMASS

Influence of Impoundments on Phytoseston Biomass of Two Small Lowland Rivers-Skierniewka and Rawka in 1983.
W91-02390 2H

Characterization of Bacterial Biomass Potential Activity by Proteolytic Activity Measurements.
W91-02830 5D

BIOREMEDIATION

Stimulation of Biologically Active Zones (BAZ's) in Porous Media by Electron-Acceptor Injection.
W91-02161 5G

Transformation Kinetics of Trace-Level Halogenated Organic Contaminants in a Biologically Active Zone (BAZ) Induced by Nitrate Injection.
W91-02162 5G

BIOTRANSFORMATION

Transformation Kinetics of Trace-Level Halogenated Organic Contaminants in a Biologically Active Zone (BAZ) Induced by Nitrate Injection.
W91-02162 5G

S-Oxygenation of Thiobencarb (Bolero) in Hepatic Preparations from Striped Bass (Morone saxatilis) and Mammalian systems.
W91-02552 5C

Transformation of Monoaromatic Hydrocarbons to Organic Acids in Anoxic Groundwater Environment.
W91-02818 5B

BLACK BASS

Skeletal Deformities in Smallmouth Bass, Micropterus dolomieui, from Southern Appalachian Reservoirs.
W91-02440 5C

BLACK FOREST

Element Budgets of Two Contrasting Catchments in the Black Forest (Federal Republic of Germany).
W91-02740 5B

BLACK SEA

Anthropogenic Influence on the Interelemental Correlation in Different Phases of the Marine Environment.
W91-02175 5B

BLACKWATER STREAMS

Blackwater Perspective on Riverine Ecosystems.
W91-02778 2H

BLOOD

Absence of Cadmium in the Blood of Horses Fed Oats Grown on Municipal Sludge-Amended Soil.
W91-02933 5E

BOATING

Sewage Lagoon to Splendid Lakes.
W91-02425 5G

BOREHOLE GEOPHYSICS

Combining Surface Geoelectrics and Borehole Measurements for Contamination Control.
W91-02685 5A

BOREHOLES

Flow to a Heated Borehole in Porous, Thermoelastic Rock: Analysis.
W91-02185 2F

BOSTON

Siting and Technology Pose Challenges for Communities Ending Ocean Disposal of Sludge.
W91-02955 5D

BOTANY BAY

Effects of Oil Spills on Macro-Invertebrates of Saltmarshes and Mangrove Forests in Botany Bay, New South Wales, Australia.
W91-02912 5C

BOTSWANA

Use of the Gould Probability Matrix Method of Reservoir Design in Arid and Semi-Arid Regions.
W91-02306 8A

Problem of Water Balance Modelling under Semi-arid Conditions.
W91-02307 7C

LIBRARY U. S. GEOLOGICAL SURVEY

BOTSWANA

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 1. Estimation of Recharge.
W91-02332 2F

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 2. Regional Investigation of Geological Structures.
W91-02333 7B

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 3. Estimation of Resources.
W91-02334 2F

BOTTOM SEDIMENTS

Influence of Cage Rearing Pisciculture on Water Quality and Bottom Sediments in Artificial Lakes.
W91-02393 5C

DDT Contamination of Benthic Macroinvertebrates and Sediments from Tributaries of Wheeler Reservoir, Alabama.
W91-02442 5B

BOUNDARY CONDITIONS

Curious Behavior of a Groundwater Flow Model.
W91-02190 2F

BRACKISH WATER

Relationship Between Mixing Process and Concentrations of Major Ions in Spanish Mediterranean Brackish Waters.
W91-02456 2K

BRAZIL

Limnology and Eutrophication of Barra Bonita Reservoir, S. Paulo State, Southern Brazil.
W91-02371 2H

Nutrients, Heavy Metals and Organic Micropollutants in an Eutrophic Brazilian Lagoon.
W91-02555 5B

BRINES

Halite Depositional Facies in a Solar Salt Pond: A Key to Interpreting Physical Energy and Water Depth in Ancient Deposits.
W91-02152 2J

BROOK TROUT

Lake Acidification and Fisheries Project: Brook Trout (Salvelinus fontinalis) Early Life Stages.
W91-02102 5C

Effects of pH, Aluminum, and Calcium on Survival and Growth of Eggs and Fry of Brook Trout (Salvelinus fontinalis).
W91-02103 5C

Effects of Water Acidity, Calcium, and Aluminum on Whole Body Ions of Brook Trout (Salvelinus fontinalis) Continuously Exposed from Fertilization to Swim-Up: A Study by Instrumental Neutron Activation Analysis.
W91-02104 5C

Whole Body Ions of Brook Trout (Salvelinus fontinalis) Alevins: Responses of Yolk-Sac and Swim-Up Stages to Water Acidity, Calcium, and Aluminum, and Recovery Effects.
W91-02105 5C

Epidermal Response to pH, Aluminum, and Calcium Exposure in Brook Trout (Salvelinus fontinalis) Fry.
W91-02106 5C

Responses of Brook Trout (Salvelinus fontinalis) Fry to Fluctuating Acid, Aluminum, and Low Calcium Exposure.
W91-02107 5C

Inorganic Monomeric Aluminum and pH as Predictors of Acidic Water Toxicity to Brook Trout (Salvelinus fontinalis).
W91-02108 5C

Aluminum and Acid Toxicity to Two Strains of Brook Trout (Salvelinus fontinalis).
W91-02109 5C

BUGLE LAKE

Bugle Lake Protection and Rehabilitation Project.
W91-02621 5G

BURKINA FASO

Review of Water Resources Investigation and Development Using Satellite Remotely Sensed Data of the Nazinga Game Area, Burkina Faso.
W91-02304 7B

Hydrologic Regime under Natural Climatic Conditions in the Lateritic Soil of Burkina Faso (Regime Hydrique en Conditions Climatiques Naturelles d'un Sol Lateritique du Burkina Faso).
W91-02317 2G

Investigation of Groundwater Recharge Mechanisms in Burkina Faso.
W91-02320 2F

Prospecting for Aquifer Fractures in the Crystalline Basement by Soil Radon Analysis (Prospection des Fractures Aquiferes du Socle Cristallin par Dosage du Gaz Radon Contenu dans le Sol).
W91-02324 2F

Solution of Disseminated Calcite in Quartz Veins of Birrimien Schists in Burkina Faso as a Key to a Possible Aquifer Model.
W91-02346 2F

Integrated Approach for the Evaluation of Groundwater Resources: A Case Study in Yatenga (Approche Integree pour l'Evaluation des Ressources en Eau Souterraines: Etude de Cas au Yatenga).
W91-02356 2F

Impact of Hydrology on Hydraulic Projects in Burkina (Impact de l'Hydrologie sur les Projets Hydrauliques au Burkina).
W91-02360 6G

Design and Management of Rural Water Supply Projects: Lessons Learned from Comparative Study of USAID Projects in Burkina Faso and Togo.
W91-02362 5F

Use of Run Off on Cultivated Fields in the Sudan-Sahelian Area: Burkina Faso, Yatenga Province, Bidi Region (Valorisation Agricole des Eaux de Ruissellement en Zone Soudano Sahelienne: Burkina Faso, Province du Yatenga, Region de Bidi).
W91-02365 3F

Impacts of Urban Waste on Surface Water in Ouagadougou and Bobo-Dioulasso (Burkina Faso) (Impacts des Rejets Urbains sur les Eaux de Surface a Ouagadougou et Bob-Dioulasso (Burkina Faso)).
W91-02369 5B

CADMIUM

Protective Action of Ions against Cadmium Toxicity to Young Bufo arenarum Tadpoles.
W91-02092 5C

Uptake of Cadmium and Nickel in Banana Prawn (Penaeus merguiensis de Man).
W91-02093 5B

Influence of Physiological Condition on Cadmium Transport from Haemolymph to Hepatopancreas in Carcinus maenas.
W91-02124 5B

Environmental Chemistry and Biological Effects of Cadmium Compounds.
W91-02173 5B

Trace Metals in the Western Mediterranean Sea.
W91-02179 5B

Variability in Concentrations of Selected Trace Elements in Water and Sediment of Six Acidic Lakes.
W91-02193 5B

Effects of Environmental Parameters on the Elimination of Cadmium by Eastern Oysters, Crassostrea virginica.
W91-02198 5B

Toxicity Test Procedures for Hyalella azteca, and Chronic Toxicity of Cadmium and Pentachlorophenol to H. azteca, Gammarus fasciatus, and Daphnia magna.
W91-02444 5A

Cost Supplement to Removal of Cadmium from Potable Water Supplies.
W91-02729 5F

Absence of Cadmium in the Blood of Horses Fed Oats Grown on Municipal Sludge-Amended Soil.
W91-02933 5E

CAIRNGORM MOUNTAINS

Hydrological and Hydrochemical Fluxes Through Vegetation and Soil in the Allt A'Mharcaidh, Western Cairngorms, Scotland: Their Effect on Streamwater Quality.
W91-02749 5B

Short-Term Ionic Responses as Indicators of Hydrochemical Processes in the Allt A'Mharcaidh Catchment, Western Cairngorms, Scotland.
W91-02750 5B

CALCITE

Solution of Disseminated Calcite in Quartz Veins of Birrimien Schists in Burkina Faso as a Key to a Possible Aquifer Model.
W91-02346 2F

CALCITE PRECIPITATION

Pelagic Calcite Precipitation and Trophic State of Hardwater Lakes.
W91-02377 2H

CALCIUM

Effects of Calcium and pH on the Reproductive Success of Amnicola limosa (Gastropoda).
W91-02064 5C

Effects of pH, Aluminum, and Calcium on Survival and Growth of Eggs and Fry of Brook Trout (Salvelinus fontinalis).
W91-02103 5C

Effects of Water Acidity, Calcium, and Aluminum on Whole Body Ions of Brook Trout (Salvelinus fontinalis) Continuously Exposed from Fertilization to Swim-Up: A Study by Instrumental Neutron Activation Analysis.
W91-02104 5C

Whole Body Ions of Brook Trout (Salvelinus fontinalis) Alevins: Responses of Yolk-Sac and Swim-Up Stages to Water Acidity, Calcium, and Aluminum, and Recovery Effects.
W91-02105 5C

Epidermal Response to pH, Aluminum, and Calcium Exposure in Brook Trout (Salvelinus fontinalis) Fry.
W91-02106 5C

Responses of Brook Trout (Salvelinus fontinalis) Fry to Fluctuating Acid, Aluminum, and Low Calcium Exposure.
W91-02107 5C

Calcium Metabolism in Two Populations of the Snail Helix aspersa on a High Lead Diet.
W91-02205 5C

Evidence for Long-Term Deterioration of Streamwater Chemistry and Soil Acidification at the Birkenes Catchment, Southern Norway.
W91-02738 5C

CALCIUM CARBONATE
Pelagic Calcite Precipitation and Trophic State of Hardwater Lakes.
W91-02377 2H

CALIBRATIONS
Estimating Groundwater Exchange with Lakes: 2. Calibration of a Three-Dimensional, Solute Transport Model to a Stable Isotope Plume.
W91-02874 2F

CALIFORNIA
Organic Selenium Distribution in Selected California Soils.
W91-02134 5B

Selenium Teratogenesis in Natural Populations of Aquatic Birds in Central California.
W91-02206 5C

Potential Hazards from Floodflows in Grapevine Canyon, Death Valley National Monument, California and Nevada.
W91-02230 2E

Water Conservation in Drought-Stricken Santa Barbara County--Response Is Slow.
W91-02423 3D

Degradation of Pesticide Waste Taken from a Highly Contaminated Soil Evaporation Pit in California.
W91-02443 5G

Characterization of Year-round Sensitivity of California's Montane Lakes to Acidic Deposition.
W91-02619 5B

Water Resources for California, Water Year 1989, Volume 3. Southern Central Valley Basins and the Great Basin from Walker River to Truckee River.
W91-02624 7C

Water Resources for California, Water Year 1989, Volume 4: Northern Central Valley Basins and the Great Basin from Honey Lake Basin to Oregon State Line.
W91-02628 7C

Superfund Record of Decision: Selma Pressure Treating Company, CA. First Remedial Action--Final.
W91-02654 5G

Hydrogeologic Assessment of Exposure to Solvent-Contaminated Drinking Water: Pregnancy Outcomes in Relation to Exposure.
W91-02935 5C

CAMEROON
Arrival of a Generation of Field Expert Systems (L'Avenement d'une Generation de Systemes Expertes de Terrain).
W91-02354 7C

CAMPYLOBACTER
Outbreak of Campylobacter Enteritis Associated with a Community Water Supply.
W91-02781 5C

CANADA
Distribution of Shrimp and Fish By-Catch Assemblages in the Canadian Eastern Arctic in Relation in Water Circulation.
W91-02066 2L

Mercury Accumulation in Relation to Size and Age of Atlantic Herring (Clupea harengus harengus) from the Southwestern Bay of Fundy, Canada.
W91-02433 5B

Glaciomarine Sedimentation in Disraeli Fjiord, High Arctic Canada.
W91-02929 2J

Integrated Chemical and Biological Study of the Bioavailability of Metals in Sediments from Two Contaminated Harbours in New Brunswick, Canada.
W91-02931 5B

CANAL DESIGN
First Step Away from Lacey's Regime Equations.
W91-02924 8B

CANCER
Environmental Epidemiology of Non-Hodgkin's Lymphoma in Eastern Nebraska.
W91-02507 5C

Drinking Water Contamination and the Incidence of Leukemia: An Ecologic Study.
W91-02509 5C

Leukemia Incidence and Radioactivity in Drinking Water in 59 Iowa Towns.
W91-02511 5C

CANOPY
Estimates of Evapotranspiration with a One- and Two-Layer Model of Heat Transfer over Partial Canopy Cover.
W91-02408 2D

CAPE COD
Breeding Biology of the Spotted Salamander Ambystoma maculatum (Shaw) in Acidic Temporary Ponds at Cape Cod, USA.
W91-02550 5C

CAPILLARY WATER
Diversion Capacity of Capillary Barriers.
W91-02887 5E

CARBAMATE PESTICIDES
Persistence of Aldicarb Residues in the Sandstone Aquifer of Prince Edward Island, Canada.
W91-02160 5B

CARBON CYCLE
Carbon Budgets of the Microbial Food Web in Estuarine Enclosures.
W91-02125 2L

CARBON DIOXIDE
Elevated Atmospheric CO2 Effects on Belowground Processes in C3 and C4 Estuarine Marsh Communities.
W91-02406 5C

CARBON FILTERS
Carbon Columns vs. the PACT Process for Priority-Pollutant Removal.
W91-02958 5D

CARBONATES
Recent Investigation of Total Carbonate in the Baltic Sea: Changes from the Past as a Result of Acid Rain.
W91-02853 5B

CARBOXYLIC ACIDS
Stabilities of Carboxylic Acids and Phenols in Los Angeles Rainwaters During Storage.
W91-02800 5A

CARCINOGENS
Drinking Water Criteria Document for Toxaphene.
W91-02733 5G

CARP
Influence of Cage Rearing Pisciculture on Water Quality and Bottom Sediments in Artificial Lakes.
W91-02393 5C

Foodweb Response to the Experimental Manipulation of a Benthivore (Cyprinus carpio), Zooplanktivore (Menidia beryllina) and Benthic Insects.
W91-02453 2H

CARSON RIVER BASIN
Water Transfers and Paper Rights in the Truckee and Carson River Basins.
W91-02266 6E

CASE STUDIES
Feasibility Study on the Groundwater Development for the Water Supply of an Oil Shale Processing Plant in Central Jordan.
W91-02720 4B

Wetlands and Groundwater: New Constraints in Groundwater Management.
W91-02722 6G

Recovery of Lotic Communities and Ecosystems from Disturbance--A Narrative Review of Case Studies.
W91-02897 5G

Overview of Case Studies on Recovery of Aquatic Systems from Disturbance.
W91-02898 5G

CAT ISLAND SWAMP
Cat Island Swamp: Window to a Fading Louisiana Ecology.
W91-02490 4C

CATALYSTS
Photocatalytic Degradation of Organophosphorous Insecticides in Aqueous Semiconductor Suspensions.
W91-02799 5D

CAVES
Glaciation and Saline-Freshwater Mixing as a Possible Cause of Cave Formation in the Eastern Midcontinent Region of the United States: A Conceptual Model.
W91-02153 2F

CESIUM RADIOISOTOPES
Correlation of Erosion Measurements and Soil Caesium-137 Content.
W91-02913 2J

CHANNEL EROSION
Controlling Mechanism of Local Scouring.
W91-02523 2J

CHANNEL FLOW
Environmental River Engineering.
W91-02845 4A

Modeling Channel Bed Transients Using Explicit F-D Schemes.
W91-02918 2E

Bed Configurations in Steady Unidirectional Water Flows: Part II. Synthesis of Flume Data.
W91-02926 2E

CHANNEL MORPHOLOGY
Fan-Delta and Braid-Delta Systems in Pennsylvanian Sandia Formation, Taos Trough, Northern New Mexico: Depositional and Tectonic Implications.
W91-02519 2J

Width and Depth of Self-Formed Straight Gravel Rivers with Bank Vegetation.
W91-02865 2E

Modeling Channel Bed Transients Using Explicit F-D Schemes.
W91-02918 2E

First Step Away from Lacey's Regime Equations.
W91-02924 8B

Bed Configurations in Steady Unidirectional Water Flows: Part I. Scale Model Study Using Fine Sands.
W91-02925 2E

Bed Configurations in Steady Unidirectional Water Flows: Part II. Synthesis of Flume Data.
W91-02926 2E

Bed Configurations in Steady Unidirectional Water Flows: Part III. Effects of Temperature and Gravity.
W91-02927 2E

CHECK STRUCTURES
Changes in Seasonal Succession of Phytoplankton Induced by the Storm-Surge Barrier in the Oosterschelde (S.W. Netherlands).
W91-02116 2L

CHELATING AGENTS
Analytical Properties of 4,4'-Biazobenzenediazoaminobenzene and Its Applications in Spectrophotometry.
W91-02548 5A

CHEMICAL ANALYSIS
Sorption Layers Impregnated with Ammonium Molybdate for the Thin Layer Chromatography in Order to Evaluate Phenol Contaminated Waters (Ammoniummolybdatimpaegnierte Sorptionschichten fuer die Duennschichtchromatographie zur Beurteilung Phenolkontaminierter Waesser).
W91-02059 5A

Preconcentration of Copper on Algae and Determination by Slurry Graphite Furnace Atomic Absorption Spectrometry.
W91-02191 5A

Enzyme-Linked Immunosorbent Assay Compared with Gas Chromatography/Mass Spectrometry for the Determination of Triazine Herbicides in Water.
W91-02192 5A

Organic Solvent-Soluble Contents of Nickel and Cobalt in Some Algae.
W91-02401 5B

Liquid Chromatography-Mass Spectrometry: An Emerging Technology for Nonvolatile Compounds.
W91-02417 5A

Analytical Properties of 4,4'-Biazobenzenediazoaminobenzene and Its Applications in Spectrophotometry.
W91-02548 5A

Determination of Trace Amounts of Acetaldehyde Using a Novel Chemiluminescence Reaction.
W91-02549 7B

Quantitative Assessment of the Sources and General Dynamics of Trace Metals in a Soft-Water Lake.
W91-02587 5B

Origin and Evolution of Formation Waters, Alberta Basin, Western Canada Sedimentary Basin. II. Isotope Systematics and Water Mixing.
W91-02889 2K

CHEMICAL COAGULATION
Effect of Charge Density and Molecular Mass of Cationic Polymers on Flocculation Kinetics in Aqueous Solution.
W91-02145 5F

CHEMICAL INTERACTIONS
From Rain to Lake: Water Pathways and Chemical Changes.
W91-02734 2K

Determination of Photochemically Produced Hydroxyl Radicals in Seawater and Freshwater.
W91-02852 5A

Metal-Organic Associations in Sediments--II. Algal Mats in Contact with Geothermal Waters.
W91-02892 2J

CHEMICAL PRECIPITATION
Halite Depositional Facies in a Solar Salt Pond: A Key to Interpreting Physical Energy and Water Depth in Ancient Deposits.
W91-02152 2J

Effects of Chemical Phosphorus Precipitation on Anaerobic Digestion.
W91-02823 5D

CHEMICAL PROPERTIES
Ozonation of o-Cresol in Aqueous Solutions.
W91-02783 5D

CHEMICAL REACTIONS
Ozonation of o-Cresol in Aqueous Solutions.
W91-02783 5D

CHEMICAL SPECIATION
Organic Solvent-Soluble Contents of Nickel and Cobalt in Some Algae.
W91-02401 5B

CHEMICAL TREATMENT
Selective Adsorption of Arsenic(V) Ion by Use of Iron(III) Hydroxide-Loaded Coral Limestone.
W91-02220 5D

Decontamination Technologies for Release from Bioprocessing Facilities: Part V. Decontamination of Sludge.
W91-02936 5D

CHEMICAL WASTES
Wastewater Treatment: Chemical Industry (Jan 70 - Sep 89). Citations from the Pollution Abstracts Database.
W91-02644 5D

Superfund Record of Decision: Selma Pressure Treating Company, CA. First Remedial Action--Final.
W91-02654 5G

Health Effects of Chemical Waste in an Urban Community.
W91-02952 5C

CHEMICAL WASTEWATER
Carbon Columns vs. the PACT Process for Priority-Pollutant Removal.
W91-02958 5D

CHEMISTRY OF PRECIPITATION
Use of Cluster Analysis to Define Periods of Similar Meteorology and Precipitation Chemistry in Eastern North America: Part I. Transport Patterns.
W91-02409 5B

Use of Cluster Analysis to Define Periods of Similar Meteorology and Precipitation Chemistry in Eastern North America: Part II. Precipitation Patterns and Pollution Deposition.
W91-02410 5B

From Rain to Lake: Water Pathways and Chemical Changes.
W91-02734 2K

Stabilities of Carboxylic Acids and Phenols in Los Angeles Rainwaters During Storage.
W91-02800 5A

Precipitation Chemistry in Central Amazonia.
W91-02840 2B

Rainfall and Surface Kinematic Conditions Over Central Amazonia During ABLE 2B.
W91-02841 2B

Computer-Controlled Automated Rain Sampler (CCARS) for Rainfall Measurement and Sequential Sampling.
W91-02914 7B

CHEMUNG RIVER
Continuous Seismic-Reflection Profiling of Glacial Drift along the Susquehanna, Chemung, and Chenango Rivers, South-Central New York and North-Central Pennsylvania.
W91-02285 7B

CHENANGO RIVER
Continuous Seismic-Reflection Profiling of Glacial Drift along the Susquehanna, Chemung, and Chenango Rivers, South-Central New York and North-Central Pennsylvania.
W91-02285 7B

CHERNOBYL
Glacial Mass Balance Determination in the Accumulation Zone by In situ Measurements of Tchernobyl Radioactivity (Determination du Bilan Glaciaire en Zone d'Accumulation par Mesure In Situ de la Radioactivite due a Tchernobyl).
W91-02052 2C

CHESAPEAKE BAY
Survival of Striped Bass Larvae and Yearlings in Relation to Contaminants and Water Quality in the Upper Chesapeake Bay.
W91-02194 5C

State of the Chesapeake Bay.
W91-02956 5G

CHEYENNE RIVER
U. S. Geological Survey Applied Research Studies of the Cheyenne River System, South Dakota: Description and Collation of Data Water Years 1987-88.
W91-02235 5I

CHILDREN'S EDUCATIONAL MATERIAL
Willie Takes a Field Trip Coloring Book.
W91-02251 9A

CHINA
Precipitation Fluctuation over Semiarid Region in Northern China and the Relationship with El Nino/Southern Oscillation.
W91-02446 2I

Aquifer Thermal Energy Storage: A Numerical Simulation of Field Experiments in China.
W91-02866 4B

CHLAMYDOMONAS
Short-Term Exposure of Zooplankton to the Synthetic Pyrethroid, Fenvalerate, and Its E

fects on Rates of Filtration and Assimilation of the Alga, Chlamydomonas reinhardii.
W91-02195 5C

CHLORDANE
Tigris-Euphrates Delta: A Major Source of Pesticides to the Shatt al-Arab River (Iraq).
W91-02463 5B

CHLORELLA
Preconcentration of Copper on Algae and Determination by Slurry Graphite Furnace Atomic Absorption Spectrometry.
W91-02191 5A

CHLORINATED AROMATIC COMPOUNDS
Residues of DDT and HCH in Major Sources of Drinking Water in Bhopal, India.
W91-02099 5B

CHLORINATED HYDROCARBONS
Residues of DDT and HCH in Major Sources of Drinking Water in Bhopal, India.
W91-02099 5B

Residues of Organochlorine Insecticides in Fish from Mahala Water Reservoir, Jaipur, India.
W91-02100 5B

Application of QSARs to Predict Potential Aquatic Toxicities of Organochlorine Pesticides.
W91-02178 5C

Residue Levels of Organochlorine Chemicals and Polychlorinated Biphenyls in Fish from the Alexandria Region, Egypt.
W91-02197 5B

Solvent Sublation of Hexachlorobutadiene and 2,4,6-Trichlorophenol.
W91-02403 5D

Premature Thelarche in Puerto Rico: A Search for Environmental Estrogenic Contamination.
W91-02429 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: I. 1,2,4-Trichlorobenzene.
W91-02436 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: II. 1,3,5-Trichlorobenzene.
W91-02437 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: III. 1,2,3-Trichlorobenzene.
W91-02438 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: IV. Pentachlorobenzene and Comparison with Trichlorobenzene Isomers.
W91-02439 5C

Microcontaminants and Reproductive Impairment of the Forster's Tern on Green Bay, Lake Michigan-1983.
W91-02441 5C

CHLORINATION
Total Trihalomethane Formation During Targeted and Conventional Chlorination of Seawater for Biofouling Control.
W91-02538 5F

Toxicological Risk/Benefit-Aspects of Drinking Water Chlorination and of Alternative Disinfection Procedures.
W91-02547 5F

CHLOROPHYLL
Soluble Fluorescence: Effects on Chlorophyll Determination at Different Salinities.
W91-02065 2L

CHLOROPHYLL A
Short Term Response to Eutrophication Abatement.
W91-02447 5G

CHLOROPHYTA
Influence of the Herbicide Paraquat 'Gramaxon' on Growth and Metabolic Activity of Three Chlorophytes.
W91-02085 4A

CHROMATOGRAPHY
Hydrocarbon Pollution in Particle-Rich Waters (Gulf of Fos-sur-mer): Comparative Study of Extraction Procedures.
W91-02854 5A

CHROMIUM
Cost Supplement to Technologies and Costs for the Removal of Chromium from Potable Water Supplies.
W91-02727 5F

CHRONIC TOXICITY
Responses of Zooplankton and Chaoborus to Temephos in a Natural Pond and in the Laboratory.
W91-02203 5C

Weathered Crude Oil Effects on Chicks of Fork-Tailed Storm-Petrels (Oceanodroma furcata).
W91-02207 5C

Toxicity of Inorganic and Organic Selenium to Daphnia magna (Cladocera) and Chironomus riparus (Diptera).
W91-02216 5C

Chronic Toxicity of Copper to a Partial Life Cycle of the Midge, Chironomus decorus.
W91-02431 5C

Toxicity Test Procedures for Hyalella azteca, and Chronic Toxicity of Cadmium and Pentachlorophenol to H. azteca, Gammarus fasciatus, and Daphnia magna.
W91-02444 5A

Analytical Approach to Assessment of Long-Term Effects of Low Levels of Contaminants in the Marine Environment.
W91-02554 5A

CHRYSOPHYTA
Toxic Effects of Tetraethyl Lead and Its Derivatives on the Chrysophyte Poteriochromonas malhamensis: VIII. Comparative Studies with Surfactants.
W91-02432 5C

CITRUS CROPS
Inhibitory Effect of Citrus unshu Peel on Anaerobic Digestion.
W91-02773 5D

Fate of Aldicarb in the Unsaturated Zone Beneath a Citrus Grove.
W91-02859 5B

CIVIL ENGINEERING
Post Graduate Course in Hydrology and Hydrogeology (Formation Post-Universitaire en Hydrologie et Hydrogeologie).
W91-02363 6E

Hydrological Education at the AGRHYMET Centre (La Formation en Hydrologie au Centre AGRHYMET).
W91-02364 6E

CLAMS
Influence of Sediment Disturbance and Water Flow on the Growth of the Soft-Shell Clam, Mya arenaria L.
W91-02062 2L

Asiatic Clam, Corbicula spp., as a Biological Monitor in Freshwater Environments.
W91-02944 5A

CLASSIFICATION
Use of Geomorphology in the Classification of Riparian Plant Associations in Mountainous Landscapes of Central Oregon, U.S.A.
W91-02496 2H

Classification of Mangrove Forest by Using 1:40,000-Scale Aerial Photographs.
W91-02504 2H

CLAY LINERS
Hazardous Waste Containment Using Clay Liners.
W91-02690 5E

CLAYS
Foundation Problems in Champlain Clays During Droughts. I: Rainfall Deficits in Montreal (1930-1988).
W91-02147 8D

Analysis of the In situ Constant-Head Permeability Test in Clays.
W91-02148 7B

Pore Pressure Field Built Up in a Rapidly Eroded Soil Mass.
W91-02149 8D

Type of Suspended Clay Influences Lake Productivity and Phytoplankton Community Response to Phosphorus Loading.
W91-02586 2H

Remobilization of Toxic Heavy Metals Adsorbed to Bacterial Wall-Clay Composites.
W91-02771 5B

Geostatic Compaction Behaviour of Kaolin Muds--Effects of Different Sample Preparation Procedures.
W91-02802 2J

Observations on the Development of Pore-Water Stresses During Piezocone Penetration in Clays.
W91-02938 7B

CLEAN WATER ACT
Low-Tech, Low-Cost Solution to Treatment in St. Ignace, Mich.
W91-02953 5D

CLEANUP OPERATIONS
Stimulation of Biologically Active Zones (BAZ's) in Porous Media by Electron-Acceptor Injection.
W91-02161 5G

Transformation Kinetics of Trace-Level Halogenated Organic Contaminants in a Biologically Active Zone (BAZ) Induced by Nitrate Injection.
W91-02162 5G

Degradation of Pesticide Waste Taken from a Highly Contaminated Soil Evaporation Pit in California.
W91-02443 5G

Superfund Record of Decision: Todtz, Lawrence Farm, IA. First Remedial Action--Final.
W91-02649 5G

In-Situ Aquifer Restoration of Chlorinated Aliphatics by Methanotrophic Bacteria.
W91-02650 5G

Superfund Record of Decision: Berks Sand Pit, PA. First Remedial Action-Final.
W91-02651 5G

LIBRARY U. OF L. Environmental Sciences

CLEANUP OPERATIONS

Superfund Record of Decision: Motorola (52nd Street Plant), AZ. First Remedial Action.
W91-02652 5G

Superfund Record of Decision: Selma Pressure Treating Company, CA. First Remedial Action--Final.
W91-02654 5G

Superfund Record of Decision: Cannon Engineering, MA. First Remedial Action--Final.
W91-02655 5G

Superfund Record of Decision: Avtex Fibers, VA. First Remedial Action.
W91-02656 5G

Superfund Record of Decision: Findett, Mo. First Remedial Action.
W91-02657 5G

Superfund Record of Decision: South Valley/ Edmunds Street, NM. Second Remedial Action.
W91-02658 5G

Superfund Record of Decision: Commencement Bay/Near Shore, WA. First Remedial Action.
W91-02659 5G

Superfund Record of Decision: Mason County Landfill, MI. First Remedial Action.
W91-02660 5G

Superfund Record of Decision: United Nuclear Corporation, NM. First Remedial Action.
W91-02661 5G

Superfund Record of Decision: Southern Maryland Wood, MD. First Remedial Action--Final.
W91-02662 5G

Superfund Record of Decision: M.W. Manufacturing, PA. First Remedial Action.
W91-02663 5G

Superfund Record of Decision: South Valley/ SJ-6, NM. Third Remedial Action.
W91-02664 5G

Superfund Record of Decision: Middletown Air Field, PA.
W91-02669 5G

CLEAR-CUTTING

Effect of Clearfelling a Sitka Spruce (Picea sitchensis) Plantation on Solute Concentrations in Drainage Water.
W91-02751 4C

CLIMATES

Climatic Influences on Streamflow Variability: A Comparison Between Southeastern Australia and Southeastern United States of America.
W91-02877 2B

CLIMATIC CHANGES

New Method to Determine Regional Evapotranspiration.
W91-02184 2D

Elevated Atmospheric CO2 Effects on Belowground Processes in C3 and C4 Estuarine Marsh Communities.
W91-02406 5C

Precipitation Fluctuation over Semiarid Regions in Northern China and the Relationship with El Nino/Southern Oscillation.
W91-02446 2B

Ecosystem Modelling: Science or Technology.
W91-02736 2H

Biosphere and Climate.
W91-02803 2A

Simulation of Lake Evaporation with Application to Modeling Lake Level Variations of Harney-Malheur Lake, Oregon.
W91-02885 2H

CLIMATIC ZONES

Geographic Distribution and Climatic Variation of the Pluvial Regimes in Baja California Sur, Mexico (Distribucion Geografica y Variabilidad Climatica de los Regimenes Pluviometricos en Baja California Sur, Mexico).
W91-02805 2B

CLIMATOLOGY

Impact of Climatic Changes on Surface Water Resources in West and Central Africa (Impact des Changements Climatiques sur les Ressources en Eau de Surface en Afrique de l'Ouest et Centrale: L'Experience de l'OSTROM).
W91-02368 7A

Climate and Climatic Resources of Reservoirs.
W91-02373 2H

Long-term Trends in the Seston Content of a Shallow Eutrophic Lake and Some Relations to Climatic Elements.
W91-02374 2H

Hydrological Aspects of the Development and Rapid Decay of the 1989 Drought.
W91-02428 2B

Precipitation Fluctuation over Semiarid Regions in Northern China and the Relationship with El Nino/Southern Oscillation.
W91-02446 2B

Biosphere and Climate.
W91-02803 2A

Sensitivity of the Surface Hydrology to the Complexity of the Land-surface Parameterization Scheme Employed.
W91-02804 7C

Geographic Distribution and Climatic Variation of the Pluvial Regimes in Baja California Sur, Mexico (Distribucion Geografica y Variabilidad Climatica de los Regimenes Pluviometricos en Baja California Sur, Mexico).
W91-02805 2B

Rainfall and Surface Kinematic Conditions Over Central Amazonia During ABLE 2B.
W91-02841 2B

Climatic Influences on Streamflow Variability: A Comparison Between Southeastern Australia and Southeastern United States of America.
W91-02877 2B

CLOSED-CONDUIT FLOW

Energy Relations in Transient Closed-Conduit Flow.
W91-02522 8B

CLOUD LIQUID WATER

Liquid Water Content and Precipitation Characteristics of Stratiform Clouds as Inferred from Satellite Microwave Measurements.
W91-02835 2B

Passive Microwave Remote Sensing of Cloud Liquid Water Over Land Regions.
W91-02836 2B

CLOUDS

Scheme for Parameterizing Ice-Cloud Water Content in General Circulation Models.
W91-02118 2C

Parameterization of the Accretion Process between Different Precipitation Elements.
W91-02120 2B

CLUSTER ANALYSIS

Use of Cluster Analysis to Define Periods of Similar Meteorology and Precipitation Chemistry in Eastern North America: Part I. Transport Patterns.
W91-02409 5B

Use of Cluster Analysis to Define Periods of Similar Meteorology and Precipitation Chemistry in Eastern North America: Part II. Precipitation Patterns and Pollution Deposition.
W91-02410 5E

COAGULATION

Investigation of the Coagulation Mechanism o the Suspended Particulate Matter in Coasta Waters.
W91-02083 2

Wastewater Treatment, The Utilization of Eart Materials as Coagulants.
W91-02412 5I

COAL GASIFICATION

Superfund Record of Decision: Commencemer Bay/Near Shore, WA. First Remedial Actio
W91-02659 5

COASTAL AQUIFERS

Modeling of Variable Density Flow, Applic tion to the Management of Coastal Aquife (Modelisation des Ecoulements a Densite Va able, Application a l'Exploitation des Aquifer Cotiers).
W91-02706

COASTAL ENVIRONMENT

Attached and Free-Living Dividing Bacteria Two Aquatic Systems.
W91-02121

Analysis of Long-Term Salinity Patterns in Louisiana Coastal Zone.
W91-02762

COASTAL LAGOONS

Nutrients, Heavy Metals and Organic Micropl lutants in an Eutrophic Brazilian Lagoon.
W91-02555

COASTAL PLAINS

Difference Between the Potentiometric Surf of the Aquia Aquifer of September 1986 September 1988 in Southern Maryland.
W91-02255

Difference Between the Potentiometric Surf of the Magothy Aquifer of September 1986 September 1988 in Southern Maryland.
W91-02256

Potentiometric Surface of the Aquia Aquife Southern Maryland During September 1988.
W91-02257

COASTAL WATERS

Investigation of the Coagulation Mechanis the Suspended Particulate Matter in Co Waters.
W91-02083

Relationship Between Mixing Process and centrations of Major Ions in Spanish Medit nean Brackish Waters.
W91-02456

Diffusion and Dispersion in Coastal Waters.
W91-02521

Analytical Approach to Assessment of l Term Effects of Low Levels of Contamina the Marine Environment.
W91-02554

Hydrocarbon Concentrations in Sediments and Animal Tissues from the Coastal Waters of Karachi.
W91-02558 5B

Fucus vesiculosus as an Indicator of Heavy Metal Availability in a Fish Farm Recipient in the Northern Baltic Sea.
W91-02560 5A

Oil Slick Sizes and Length of Coastline Affected: A Literature Survey and Statistical Analysis--Final Report.
W91-02671 5B

Pathogenic Marine Vibrio Species in Selected Nova Scotian Recreational Coastal Waters.
W91-02780 5B

COASTS
Controls and Effects of Continental Brine Formation in a Supratidal Ephemeral Lake in the Semi-arid Environment of Spencer Gulf, South Australia.
W91-02806 2H

COBALT
Determination of Cobalt by Adsorptive Stripping Voltammetry Using Cobalt(II)-Nioxime-Nitrite Catalytic System.
W91-02513 5A

COBALT RADIOISOTOPES
Modeling the Mass-Transfer Rate of Radioactive Cobalt from a Synthetic Groundwater to Volcanic Tuff Media.
W91-02163 5B

COCKFIELD FORMATION
Geology and Ground-Water Resources of the Cockfield Formation in Western Tennessee.
W91-02225 2F

COLIFORMS
Septic Tank and Agricultural Non-Point Source Pollution Within a Rural Watershed.
W91-02177 5B

Assessing Defined-Substrate Technology for Meeting Monitoring Requirements of the Total Coliform Rule.
W91-02420 5A

COLLOIDS
Effect of Water Quality on Bacterioplankton Densities in River, Brook and Peat Mining Water in the Basin of the Humic River Kiiminkijoki, Northern Finland. .
W91-02455 5C

COLORIMETRY
Analytical Properties of 4,4'-Biazobenzenediazoaminobenzene and Its Applications in Spectrophotometry.
W91-02548 5A

COLUMBIA PLATEAU
Water-Quality Characteristics of the Columbia Plateau Regional Aquifer System in Parts of Washington, Oregon, and Idaho.
W91-02223 2F

COMPACTION
Observations on the Development of Pore-Water Stresses During Piezocone Penetration in Clays.
W91-02938 7B

COMPETING USE
Transaction Costs and Resolution of Reserved Rights Claims.
W91-02267 6E

Salmon and the Snake: Meeting Fish Flow Objectives in a Semi-Arid River Basin.
W91-02279 6D

COMPOSTING
Regional Sludge Management Planning in Vermont.
W91-02954 5E

COMPRESSIVE STRENGTH
Compressive Strength Behavior of Fine-Grained Frozen Soils.
W91-02940 8D

COMPUTER MODELS
EXAMS 2: Exposure Analysis Modeling System.
W91-02174 7B

MESIP: Modelling Environmental Scenarios in Ponds.
W91-02176 7C

Predicting Concentrations of Consumer Product Chemicals in Estuaries.
W91-02211 5B

Mass-Conserving Method of Characteristics for Streamflow Modeling.
W91-02234 2E

Supercomputers and Their Use in Modeling Subsurface Solute Transport.
W91-02543 7C

Interactive Groundwater Modelling: Colour Graphics, ICAD and AI.
W91-02699 2F

COMPUTER PROGRAMS
EXAMS 2: Exposure Analysis Modeling System.
W91-02174 7B

Use of Personal Computers for the Analysis and Management of Hydrometeorological and Groundwater Data.
W91-02351 7C

Potential for Expert Systems in Water Utility Operation and Management.
W91-02415 5F

Testing Expert System for Activated Sludge Process Control.
W91-02573 5D

COMPUTERS
Electronics and Informatics for the Acquisition of Hydrometeorological Data: A Great Tool for Water Resource Management in the Sahel (Electronique et Informatique pour l'Acquisition des Donnees Hydrometeorologiques, un Outil Prodigieux pour la Gestion des Ressources en Eau dans le Sahel).
W91-02303 7B

Arrival of a Generation of Field Expert Systems (L'Avenement d'une Generation de Systemes Expertes de Terrain).
W91-02354 7C

Computer-Controlled Well Field and Distribution System.
W91-02427 5F

Supercomputers and Their Use in Modeling Subsurface Solute Transport.
W91-02543 7C

CONCRETE DAMS
Sir Dam and Powerplant.
W91-02112 8A

Relationship of Reservoir Biogeochemical Processes to the Structural Integrity of the World's First Totally Roller Compacted Concrete Dam.
W91-02399 8F

CONCRETE TECHNOLOGY
Relationship of Reservoir Biogeochemical Processes to the Structural Integrity of the World's First Totally Roller Compacted Concrete Dam.
W91-02399 8F

CONCRETE TESTING
Surface Treatments to Minimize Concrete Deterioration. Report 2: Laboratory Evaluation of Surface Treatment Materials.
W91-02611 8F

CONCRETES
Surface Treatments to Minimize Concrete Deterioration. Report 2: Laboratory Evaluation of Surface Treatment Materials.
W91-02611 8F

CONDUITS
New Madrid Pumping Station Gravity Flow Conduit and Confluence, New Madrid Floodway, Missouri: Hydraulic Model Investigation.
W91-02605 8B

CONFIDENCE LIMITS
Approximation of Confidence Limits on Sample Semivariograms from Single Realizations of Spatially Correlated Random Fields.
W91-02187 7C

CONFINED AQUIFERS
Artificial Recharge in the Angas-Bremer Irrigation Area.
W91-02530 4B

CONFLICTING USE
Indian Water Claims Negotiations: Conflicting Federal Roles.
W91-02263 6E

Water Transfers and Paper Rights in the Truckee and Carson River Basins.
W91-02266 6E

CONGO
Vulnerability of the Brazzaville Aquifer and the Risk of Contamination with Domestic Wastes (Problemes de Vulnerabilite de la Nappe de Brazzaville et Risques de Contamination par les Rejets Domestiques).
W91-02339 5B

CONJUNCTIVE USE
Modelling of Flow and Contaminant Transport in a Conjunctively Managed Groundwater Basin: A Case Study.
W91-02707 5B

CONNATE WATER
Origin and Evolution of Formation Waters, Alberta Basin, Western Canada Sedimentary Basin: I. Chemistry.
W91-02888 2K

Origin and Evolution of Formation Waters, Alberta Basin, Western Canada Sedimentary Basin. II. Isotope Systematics and Water Mixing.
W91-02889 2K

Sulphur and Oxygen Isotopes of Dissolved Sulphur Species in Formation Waters from the Dogger Geothermal Aquifer, Paris Basin, France.
W91-02890 2K

Modelling of the Evolution of Ground Waters in a Granite System at Low Temperature: The Stripa Ground Waters, Sweden.
W91-02893 2K

CONSERVATION
Vegetation Change on the Ouse Washes Wetland, England, 1972-1988 and Effects on Their Conservation Importance.
W91-02515 2H

Assessment of Bank Slope as a Predictor of Conservation Status in River Corridors.
W91-02516 2H

CONSOLIDATION SEDIMENTATION
Geostatic Compaction Behaviour of Kaolin Muds--Effects of Different Sample Preparation Procedures.
W91-02802 2J

CONSUMPTIVE USE
Remote Sensing Applications for Consumptive Use (Evapotranspiration).
W91-02594 7B

Estimates of Consumptive Use and Evapotranspiration in Palo Verde Valley, California, 1981 and 1983.
W91-02597 2D

Agricultural Water Use Monitoring Through Landsat Surveillance.
W91-02600 3F

CONTINUOUS SEISMIC REFLECTION
Evaluation of the Continuous Seismic-Reflection Method for Determining the Thickness and Lithology of Stratified Drift in the Glaciated Northeast.
W91-02284 7B

Continuous Seismic-Reflection Profiling of Glacial Drift along the Susquehanna, Chemung, and Chenango Rivers, South-Central New York and North-Central Pennsylvania.
W91-02285 7B

CONTRACTS
Advantages of Turnkey Contracts in Hydro Development.
W91-02114 8A

CONTROL SYSTEMS
Using Programmable Logic Controllers.
W91-02566 5D

CONVECTIVE PRECIPITATION
Doppler-Radar Analysis of a Low-Precipitation Severe Storm.
W91-02760 2B

CONVEYANCE STRUCTURES
Sliplining Rescues Sewers and a Small Budget.
W91-02424 8A

COPPER
Trace Metals in the Western Mediterranean Sea.
W91-02179 5B

Preconcentration of Copper on Algae and Determination by Slurry Graphite Furnace Atomic Absorption Spectrometry.
W91-02191 5A

Acute Toxicity of Aqueous and Substrate-Bound Copper to the Midge, Chironomus decorus.
W91-02430 5C

Chronic Toxicity of Copper to a Partial Life Cycle of the Midge, Chironomus decorus.
W91-02431 5C

Superfund Record of Decision: M.W. Manufacturing, PA. First Remedial Action.
W91-02663 5G

COPPER RIVER
Woody Plant Succession on Earthquake-Uplifted Coastal Wetlands of the Copper River Delta, Alaska.
W91-02498 2H

CORN
Influence of Plant Water Stress on Net Photosynthesis and Leaf Area of Two Maize (Zea mays L.) Cultivars.
W91-02075 3F

Water Vapor Transport through a Flail-Chopped Corn Residue.
W91-02130 3F

CORRELATION ANALYSIS
Anthropogenic Influence on the Interelemental Correlation in Different Phases of the Marine Environment.
W91-02175 5B

Approximation of Confidence Limits on Sample Semivariograms from Single Realizations of Spatially Correlated Random Fields.
W91-02187 7C

CORROSION
Corrosivity Problems in Rural Water Supply Projects in Sahelian Areas of West Africa.
W91-02337 2F

Impact of Handpump Corrosion on Water Quality.
W91-02338 5F

Relationship of Reservoir Biogeochemical Processes to the Structural Integrity of the World's First Totally Roller Compacted Concrete Dam.
W91-02399 8F

COST ALLOCATION
Indian Water Rights Settlements: The Role of Local Repayment and Operating Entities Responsible for Federal Reclamation Projects.
W91-02265 6E

COST ANALYSIS
Advantages of Turnkey Contracts in Hydro Development.
W91-02114 8A

COST-BENEFIT ANALYSIS
Transaction Costs and Resolution of Reserved Rights Claims.
W91-02267 6E

Economic Benefit Considerations in Selecting Water Quality Projects. Insights from the Rural Clean Water Program.
W91-02622 5G

COSTS
Transaction Costs and Resolution of Reserved Rights Claims.
W91-02267 6E

Technologies and Costs for the Treatment of Microbial Contaminants in Potable Water Supplies.
W91-02614 5F

Cost Supplement to Technologies and Costs for the Removal of Mercury from Potable Water Supplies.
W91-02725 5F

Cost Supplement to Technologies and Costs for the Removal of Nitrates and Nitrites from Potable Water Supplies.
W91-02726 5F

Cost Supplement to Technologies and Costs for the Removal of Chromium from Potable Water Supplies.
W91-02727 5F

Cost Supplement to Technologies and Costs for the Removal of Selenium from Potable Water Supplies.
W91-02728 5F

Cost Supplement to Removal of Cadmium from Potable Water Supplies.
W91-02729 5F

Cost Supplement to Technologies and Costs for the Removal of Asbestos from Potable Water Supplies.
W91-02730 5F

CRABS
Influence of Physiological Condition on Cadmium Transport from Haemolymph to Hepatopancreas in Carcinus maenas.
W91-02124 5B

Tributyltin Retards Regeneration and Produces Deformities of Limbs in the Fiddler Crab, Uca pugilator.
W91-02434 5C

CRANBERRIES
Fate of Parathion in Ground Water in Commercial Cranberry Culture in the New Jersey Pinelands.
W91-02098 5E

CRESOL
Ozonation of o-Cresol in Aqueous Solutions
W91-02783 5D

CROPS
Screening for Drought Tolerance: Soybean Germination and Its Relationship to Seedling Responses.
W91-02074 3I

Influence of Plant Water Stress on Net Photosynthesis and Leaf Area of Two Maize (Zea mays L.) Cultivars.
W91-02075 3

CRUSTACEANS
Reciprocal Diel Vertical Migration Behavior i Planktivores and Zooplankton in British Columbia Lakes.
W91-02067 2

Acute Toxicity of Industrial Surfactants to M sidopsis bahia.
W91-02445 5

CRYPTOSPORIDIUM
Comparison of the Zinc Sulfate and Immun fluorescence Techniques for Detecting Giard and Cryptosporidium.
W91-02419 5

CRYSTALLIZATION
Halite Depositional Facies in a Solar Salt Por A Key to Interpreting Physical Energy a Water Depth in Ancient Deposits.
W91-02152

CRYSTALLOGRAPHY
Structure of an Anhydride Related to a Mu genic Component of Drinking Water, 3-Chlo 4-(dichloromethyl)-5-hydroxy-2(5H)-furanone.
W91-02551

CUBA
Evaluation of the Sea Urchin Echinometra cunter as an Indicator of Heavy-Metal Contamination in Cuba (Evaluacion del Erizo de M Echinometra Iucunter como Indicator de Cor minacion por Metales Pesados, Cuba).
W91-02044

CULTIVATED LANDS
Use of Run Off on Cultivated Fields in Sudan-Sahelian Area: Burkina Faso, Yate Province, Bidi Region (Valorisation Agric des Eaux de Ruissellement en Zone Soud Sahelienne: Burkina Faso, Province du Yate Region de Bidi).
W91-02365

CYANIDE
Changes in Plasma, Liver, and Ovary Vite genin in Landlocked Atlantic Salmon Follow Exposure to Sublethal Cyanide.
W91-02196

Influence of Season and Exercise on the Lethal Toxicity of Cyanide to Rainbow Trout (Salmo gairdneri).
W91-02458 5C

Electrolytic Decomposition of Cyanide Effluent with an Electrochemical Reactor Packed with Stainless Steel Fiber.
W91-02784 5D

CYANOPHYTA
Degradation of Blue Green Alga, Microcystis Aeruginosa by Flagellata, Monas Guttula.
W91-02826 5F

CYCLING NUTRIENTS
Phosphorus Cycle and Its Significance in the Eutrophication of Lake Sevan.
W91-02376 5C

Patterns and Controls of Nitrogen in Tallgrass Prairie Streams.
W91-02405 2H

Biogeochemical Cycling Constraints on Stream Ecosystem Recovery.
W91-02906 2H

CYPRESS SWAMPS
Multiple Demands on Wetlands.
W91-02779 2H

CYSTEINE
Use of Kinetic Bioassay Procedure to Estimate Sulfate and Cysteine Concentrations in Sediment.
W91-02796 2H

CYTOLOGY
Toxic Effects of Tetraethyl Lead and Its Derivatives on the Chrysophyte Poteriochromonas malhamensis: VIII. Comparative Studies with Surfactants.
W91-02432 5C

CZECHOSLOVAKIA
Water Quality in Czechoslovak Water-Supply Impoundments.
W91-02386 2H

Water Quality in Reservoirs: The Effect of Inflowing Pollution.
W91-02387 5B

Water Quality in the Sance Reservoir (North Moravia).
W91-02392 5G

DALAPON
Sublethal Effects of 2,2-Dichloropropionic Acid (Dalapon) on Fossaria cubensis, Intermediate Host of the Liver Fluke, Fasciola hepatica.
W91-02095 5C

DAM CONSTRUCTION
Ataturk Nears Completion.
W91-02111 8A

Sir Dam and Powerplant.
W91-02112 8A

Monitoring System for Detecting Movements of Penstock Supports.
W91-02113 8G

Advantages of Turnkey Contracts in Hydro Development.
W91-02114 8A

DAM DESIGN
Hydrologic Design and Development of Hydraulic Structures.
W91-02312 8A

Interflux Dams: Their Advantage for Saharan and Sahelian Africa (Les Barrages d'Inferoflux: Leur Interet pour l'Afrique Saharienne et Sahelienne).
W91-02313 8A

Finite Element Combined Surface Water/Groundwater Model for the River Rhine, Kehl/Strasbourg Reservoir.
W91-02716 5G

DAM EFFECTS
Environmental and Agricultural Implications of Dam Construction in the Niger Valley of Mali.
W91-02359 6G

Impact of Hydrology on Hydraulic Projects in Burkina (Impact de l'Hydrologie sur les Projets Hydrauliques au Burkina).
W91-02360 6G

Influence of Impoundments on Phytoseston Biomass of Two Small Lowland Rivers-Skierniewka and Rawka in 1983.
W91-02390 2H

Groundwater Flow and Quality Studies in Szigetkoz Region, Northwest Hungary.
W91-02724 6G

DAM FAILURE
Relationship of Reservoir Biogeochemical Processes to the Structural Integrity of the World's First Totally Roller Compacted Concrete Dam.
W91-02399 8F

Hydraulic Fracture in Earth and Rock-Fill Dams.
W91-02942 8A

DAM FOUNDATIONS
Hydraulic Fracture in Earth and Rock-Fill Dams.
W91-02942 8A

DAMS
Ataturk Nears Completion.
W91-02111 8A

Sir Dam and Powerplant.
W91-02112 8A

Monitoring System for Detecting Movements of Penstock Supports.
W91-02113 8G

Advantages of Turnkey Contracts in Hydro Development.
W91-02114 8A

Soviet Design of Large Turbines for Wide Head Ranges.
W91-02155 8C

Water Resources Management in Nigeria: The River Basin Approach.
W91-02357 4A

Impact of Hydrology on Hydraulic Projects in Burkina (Impact de l'Hydrologie sur les Projets Hydrauliques au Burkina).
W91-02360 6G

DANUBE RIVER
Groundwater Flow and Quality Studies in Szigetkoz Region, Northwest Hungary.
W91-02724 6G

DAPHNIA
Toxicity of Inorganic and Organic Selenium to Daphnia magna (Cladocera) and Chironomus riparus (Diptera).
W91-02216 5C

Chronic Effects of 2,2'-dichlorobiphenyl on Reproduction, Mortality, Growth, and Respiration of Daphnia pulicaria.
W91-02466 5C

DARCYS LAW
Comparison of Darcian Flow in Corresponding Flat and Folded Surfaces.
W91-02186 2F

DATA ACQUISITION
Glacial Mass Balance Determination in the Accumulation Zone by In situ Measurements of Tchernobyl Radioactivity (Determination du Bilan Glaciaire en Zone d'Accumulation par Mesure In Situ de la Radioactivite due a Tchernobyl).
W91-02052 2C

Measuring Epilithic Bacterial Production in Streams.
W91-02070 2H

Streamflow Data and Surface-Water Resource Assessment - A Quantitative Demonstration of Need for Adequate Investment in Data Collection in Developing Countries.
W91-02141 7A

Analysis of the In situ Constant-Head Permeability Test in Clays.
W91-02148 7B

Field Frost Heave Measurement and Prediction During Periods of Seasonal Frost.
W91-02150 2C

Methods for Measuring the Saturated Hydraulic Conductivity of Tills.
W91-02166 7B

Water-Resources Activities of the U.S. Geological Survey in Kansas--Fiscal Years 1987 and 1988.
W91-02236 7C

Willie Takes a Field Trip Coloring Book.
W91-02251 9A

Evaluation of the Continuous Seismic-Reflection Method for Determining the Thickness and Lithology of Stratified Drift in the Glaciated Northeast.
W91-02284 7B

Continuous Seismic-Reflection Profiling of Glacial Drift along the Susquehanna, Chemung, and Chenango Rivers, South-Central New York and North-Central Pennsylvania.
W91-02285 7B

Electronics and Informatics for the Acquisition of Hydrometeorological Data: A Great Tool for Water Resource Management in the Sahel (Electronique et Informatique pour l'Acquisition des Donnees Hydrometeorologiques, un Outil Prodigieux pour la Gestion des Ressources en Eau dans le Sahel).
W91-02303 7B

Quantifying the Water Balance of Dryland Millet in Niger Using State of the Art Evaporation Techniques.
W91-02316 3F

Exploration of Karstified Joints in Precambrian Limestone Aquifers of the Gondo Plain (Mali) with Electromagnetic Horizontal-Loop Methods (Localisation des Fractures Karstifiees des Calcaires Precambbriens dans la Plaine du Gondo (Mali) par la Prospection Electromagnetique Bipole).
W91-02321 2F

New Instruments for Electrical and Audiomagnetotelluric Prospecting (Caracteristiques des Equipements Modernes de Prospection Geophysique par Methods Electrique ou Audiomagnetotellurique).
W91-02326 7B

Geophysical Reconnaissance in a Fissured Structure: Example in Liptako, Rep. Niger (Reconnaissance Geophysique en Milieu Fissure: Exemple au Liptako, Rep. Niger).
W91-02327 2F

DATA ACQUISITION

Utilization of the ARGOS System Within the Framework of the Hydrometric Network of Benin (L'Utilisation du Systeme ARGOS dans le Cadre du Reseau Hydrometrique Beninois).
W91-02340 7B

Hydrological Network, Data Banks, and Teletransmission (Reseaux Hydrologiques, Banques de Donnees Informatisees et Teletransmission).
W91-02352 7B

Teletransmission of Hydrological Data Within the Framework of the Programme to Combat Onchocerciasis (Teletransmission des Donnees Hydrologiques dans le Cadre du Programme de Lutte Contre l'Onchocercose).
W91-02353 7B

Present Situation of the European Floodplain Forests.
W91-02471 4C

Sampling Intensity and Species Richness: Effects on Delineating Southwestern Riparian Plant Communities.
W91-02492 2H

Inventory Technology: 'Ebb Tides', 'Flash Floods', and 'Whirlpools'.
W91-02502 7A

PC-Based Analytical Stereoplotter for Wetland Inventories: An Efficient and Economical Photogrammetric Instrument for Field Offices.
W91-02503 7B

Synoptic Inventory of Riparian Ecosystems: The Utility of Landsat Thematic Mapper Data.
W91-02506 2H

Remote Sensing Applications for Consumptive Use (Evapotranspiration).
W91-02594 7B

Information Collection Request for: National Primary Drinking Water Regulations for Inorganic Chemicals.
W91-02602 7B

Guidelines for Physical and Biological Monitoring of Aquatic Dredged Material Disposal Sites.
W91-02607 5A

Investigation of Rest Area Requirements: Appendix-Pertinent Rest Area Literature.
W91-02620 5D

Method for the Quantitative Evaluation of Fish Movements in Salt Ponds by Acoustic Telemetry.
W91-02782 7B

Estimates of Daily Rainfall Over the Amazon Basin.
W91-02842 2B

DATA COLLECTIONS

Streamflow Data and Surface-Water Resource Assessment - A Quantitative Demonstration of Need for Adequate Investment in Data Collection in Developing Countries.
W91-02141 7A

Water-Resources Activities of the U.S. Geological Survey in Kansas--Fiscal Years 1987 and 1988.
W91-02236 7C

Preparation of Average Annual Runoff Map of the United States, 1951-80.
W91-02247 7C

Ground-Water Levels in Arkansas, Spring 1990.
W91-02250 7C

Activities of the Alaska District, Water Resources Division, U. S. Geological Survey, 1990.
W91-02259 7C

Water Resources Data for Arkansas, Water Year 1989.
W91-02261 7C

CIEH's Contribution to the Development of Hydrology in Arid and Semi-Arid Areas in Africa (Contribution du CIEH au Developpement de l'Hydrologie dans les Zones Arides et Semi-arides d'Afrique).
W91-02292 2A

Oil Pollution in the Southern Arabian Gulf and Gulf of Oman.
W91-02559 5B

Monitoring Program Assesses Water Quality Progress.
W91-02561 5D

Water Resources for California, Water Year 1989, Volume 3. Southern Central Valley Basins and the Great Basin from Walker River to Truckee River.
W91-02624 7C

Water Resources for Florida, Water Year 1989, Volume 2A. South Florida - Surface Water.
W91-02625 7C

Water Resources Data for Florida, Water Year 1989, Volume 2B. South Florida - Ground Water.
W91-02626 7C

Water Resources Data for Florida, Water Year 1989, Volume 3A: Southwest Florida Surface Water.
W91-02627 7C

Water Resources for California, Water Year 1989, Volume 4: Northern Central Valley Basins and the Great Basin from Honey Lake Basin to Oregon State Line.
W91-02628 7C

Water Resources Data for Massachusetts and Rhode Island, Water Year 1988.
W91-02629 7C

Water Resources Data for Missouri, Water Year 1989.
W91-02630 7C

Water Resources Data for Montana, Water Year 1989.
W91-02631 7C

Water Resources Data for New Jersey, Water Year 1989, Volume 1: Atlantic Slope Basins, Hudson River to Cape May.
W91-02632 7C

Water Resources Data for New Jersey, Water Year 1989, Volume 2: Delaware River Basin and Tributaries to Delaware Bay.
W91-02633 7C

Water Resources Data for New York, Water Year 1989, Volume 2: Long Island.
W91-02634 7C

Water Resources Data for Pennsylvania, Water Year 1989. Volume 2: Susquehanna and Potomac River Basins.
W91-02635 7C

Water Resources Data for Puerto Rico and the U.S. Virgin Islands, Water Year 1989.
W91-02636 7C

Water Resources Data for South Carolina, Water Year 1989.
W91-02637 7C

Water Resources Data for South Dakota, Water Year 1989.
W91-02638 7C

Water Resources Data for Texas, Water Year 1989. Volume 2: San Jacinto River, Brazos River, San Bernard River Basins and Intervening Coastal Basins.
W91-02639 7C

Water Resources Data for Texas, Water Year 1989. Volume 3: Colorado River, Lavaca River, Guadalupe River, Nueces River, Rio Grande Basins and Intervening Coastal Basins.
W91-02640 7C

Water Resources Data for Washington, Water Year 1989.
W91-02641 7C

DATA INTERPRETATION

Analysis by Functions Applied to Hydrometry (L'analyse par Fonctions Application a 'Hydrometrie).
W91-02050 7C

Scheme for Parameterizing Ice-Cloud Water Content in General Circulation Models.
W91-02118 2C

Simplified Method to Estimate Regional 24-h Evapotranspiration from Thermal Infrared Data.
W91-02129 2D

Estimates of Consumptive Use and Evapotranspiration in Palo Verde Valley, California, 1981 and 1983.
W91-02597 2D

Outliers in Groundwater Quality Time Series
W91-02687 7C

Method for the Quantitative Evaluation of Fish Movements in Salt Ponds by Acoustic Telemetry.
W91-02782 7I

Sensitivity of the Surface Hydrology to the Complexity of the Land-surface Parameterization Scheme Employed.
W91-02804 7C

Rainfall and Surface Kinematic Conditions Over Central Amazonia During ABLE 2B.
W91-02841 2I

Low Flow Estimation Based on River Recession Rate.
W91-02847 2I

DATA PROCESSING

Use of Personal Computers for the Analysis and Management of Hydrometeorological and Groundwater Data.
W91-02351 7C

Hydrological Network, Data Banks, and Tele transmission (Reseaux Hydrologiques, Banque de Donnees Informatisees et Teletransmission
W91-02352 7

DATA STORAGE AND RETRIEVAL

Analysis by Functions Applied to Hydrometr (L'analyse par Fonctions Application a 'Hydrometrie).
W91-02050 7

Inventory Technology: 'Ebb Tides', 'Flas Floods', and 'Whirlpools'.
W91-02502 7

Proposed Framework and Database for El Auditing.
W91-02950 7

DATABASES

Application of a Digital Geographic Data Ba to Irrigation Water Rights Management.
W91-02598 6

Proposed Framework and Database for EIA Auditing.
W91-02950 7B

DDD
Persistence of DDT in the Yakima River Drainage, Washington.
W91-02457 5B

Tigris-Euphrates Delta: A Major Source of Pesticides to the Shatt al-Arab River (Iraq).
W91-02463 5B

Spatial Differences and Temporal Trends of Organochlorine Compounds in Biota from the Northwestern Hemisphere.
W91-02467 5B

DDE
Persistence of DDT in the Yakima River Drainage, Washington.
W91-02457 5B

Tigris-Euphrates Delta: A Major Source of Pesticides to the Shatt al-Arab River (Iraq).
W91-02463 5B

Spatial Differences and Temporal Trends of Organochlorine Compounds in Biota from the Northwestern Hemisphere.
W91-02467 5B

DDT
Residues of DDT and HCH in Major Sources of Drinking Water in Bhopal, India.
W91-02099 5B

DDT Contamination of Benthic Macroinvertebrates and Sediments from Tributaries of Wheeler Reservoir, Alabama.
W91-02442 5B

Persistence of DDT in the Yakima River Drainage, Washington.
W91-02457 5B

Tigris-Euphrates Delta: A Major Source of Pesticides to the Shatt al-Arab River (Iraq).
W91-02463 5B

Spatial Differences and Temporal Trends of Organochlorine Compounds in Biota from the Northwestern Hemisphere.
W91-02467 5B

DEATH VALLEY NATIONAL MONUMENT
Potential Hazards from Floodflows in Grapevine Canyon, Death Valley National Monument, California and Nevada.
W91-02230 2E

DECISION MAKING
Guidance Document for Providing Alternative Water Supplies.
W91-02601 5G

Prediction of the Concentration Distribution of Groundwater Pollutants.
W91-02684 5B

Proposed Framework and Database for EIA Auditing.
W91-02950 7B

DECOMPOSITION
Growth, Production, and Decomposition Dynamics of Sphagnum Under Natural and Experimentally Acidified Conditions.
W91-02404 5C

DECONTAMINATION
Thermophilic Campylobacters in Two Sewage Treatment Plants in Libya.
W91-02122 5D

Degradation of Pesticide Waste Taken from a Highly Contaminated Soil Evaporation Pit in California.
W91-02443 5G

Decontamination Technologies for Release from Bioprocessing Facilities: Part V. Decontamination of Sludge.
W91-02936 5D

Decontamination Technologies for Release from Bioprocessing Facilities: Part VI. Verification of Wastewater Decontamination.
W91-02937 5D

DEEP BED FILTRATION
Ionic Strength in Deep Bed Filtration.
W91-02801 5D

DEGRADATION
Application of Two-Site/Two-Region Models for Studying Simultaneous Nonequilibrium Transport and Degradation of Pesticides.
W91-02132 5B

Source, Extent, and Degradation of Herbicides in a Shallow Aquifer Near Hesston, Kansas.
W91-02252 5B

Persistence of Spilled Crude Oil in a Tropical Intertidal Environment.
W91-02556 5B

DELAWARE BAY
Withdrawal of Shelf Water into an Estuary: A Barotropic Model.
W91-02831 2L

Some Observational Evidence on the Effect of Atmospheric Forcing on Tidal Variability in the Upper Delaware Bay.
W91-02833 2L

DELAWARE RIVER
Carbon Columns vs. the PACT Process for Priority-Pollutant Removal.
W91-02958 5D

DELTAS
Environmental and Agricultural Implications of Dam Construction in the Niger Valley of Mali.
W91-02359 6G

Tigris-Euphrates Delta: A Major Source of Pesticides to the Shatt al-Arab River (Iraq).
W91-02463 5B

Woody Plant Succession on Earthquake-Uplifted Coastal Wetlands of the Copper River Delta, Alaska.
W91-02498 2H

Fan-Delta and Braid-Delta Systems in Pennsylvanian Sandia Formation, Taos Trough, Northern New Mexico: Depositional and Tectonic Implications.
W91-02519 2J

DENITRIFICATION
Denitrification by an Expanded Bed Biofilm Reactor.
W91-02539 5D

Finite Element Groundwater Model as Essential Planning Tool: Microbiological Denitrification of a Well Field at Broichhof.
W91-02703 5F

DENMARK
Saturated Hydraulic Conductivity of Clayey Tills and the Role of Fractures.
W91-02168 2F

Unsaturated Hydraulic Conductivity Determined by the Hot Air Method for Some Danish Till Soils.
W91-02169 2G

Application of Groundwater Modelling in Water Resources Management in Denmark.
W91-02719 5B

DENSITY STRATIFICATION
Experimental Investigation of Variable Density Flow and Mixing in Homogeneous and Heterogeneous Media.
W91-02862 2F

DEPOSITION
Halite Depositional Facies in a Solar Salt Pond: A Key to Interpreting Physical Energy and Water Depth in Ancient Deposits.
W91-02152 2J

DESALINATION
Leigh Creek Town Water Supply--A History.
W91-02528 5F

DESALINATION PLANTS
Recovery of Mineral Salts and Potable Water from Desalting Plant Effluents by Evaporation. Part II. Proposed Simulation System for Salt Recovery.
W91-02402 3A

DESALINATION WASTES
Recovery of Mineral Salts and Potable Water from Desalting Plant Effluents by Evaporation. Part II. Proposed Simulation System for Salt Recovery.
W91-02402 3A

DESERTIFICATION
Precipitation Fluctuation over Semiarid Regions in Northern China and the Relationship with El Nino/Southern Oscillation.
W91-02446 2B

DESERTS
Inorganic Pollution of the Man-Made Lakes of Wadi El-Raiyan and Its Impact on Aquaculture and Wildlife of the Surrounding Egyptian Desert.
W91-02462 5B

DESIGN CRITERIA
Simplified Optimisation Procedure for Fixed Bed Adsorption Systems.
W91-02081 5D

Hydrologic Design and Development of Hydraulic Structures.
W91-02312 8A

Scientific and Technical Evaluation of Mathematical Models in the Planning Design and Operation of Hydrosystems in Africa.
W91-02350 2E

DESIGN FLOODS
Analysis of Water Surface and Flow Distribution for the Design Flood at a Proposed Highway Crossing of the Sabine River Near Tatum, Texas.
W91-02226 2E

DESIGN FLOW
Analysis of Water Surface and Flow Distribution for the Design Flood at a Proposed Highway Crossing of the Sabine River Near Tatum, Texas.
W91-02226 2E

DESIGN STORMS
Frequency-Related Temporally and Spatially Varied Rainfall.
W91-02524 2B

DETOXIFICATION
Detection of Organophosphorus Pesticide Detoxifying Bacterial Colonies, Using UV-Photography of Parathion-Impregnated Filters.
W91-02200 5B

Assessing Detoxification of a Complex Hazardous Waste, Using the Microtox Bioassay.
W91-02204 5E

DETRITUS
Characteristics of Coarse Wood Debris for Several Coastal Streams of Southeast Alaska, USA.
W91-02063 4C

DEUTERIUM
Tritium, Oxygen-18, and Deuterium Diffusion at the Confederation Road Landfill Site, Sarnia, Ontario, Canada.
W91-02146 5B

Use of Oxygen-18 and Deuterium Mass-Balance Analysis to Evaluate Induced Recharge to Stratified-Drift Aquifers.
W91-02287 2F

DEVELOPING COUNTRIES
Rapid Evaluation of Salt Tolerance of Mangrove-Swamp Rice Varieties.
W91-02077 3C

Measuring Soil Loss in Different Land-Use Systems on an Oxic Paleustalf in Lusitu, Zambia.
W91-02078 4D

Streamflow Data and Surface-Water Resource Assessment - A Quantitative Demonstration of Need for Adequate Investment in Data Collection in Developing Countries.
W91-02141 7A

Advances Towards Water Resources Development Through Hydrological Training and Education.
W91-02293 6E

Vulnerability of the Brazzaville Aquifer and the Risk of Contamination with Domestic Wastes (Problemes de Vulnerabilite de la Nappe de Brazzaville et Risques de Contamination par les Rejets Domestiques).
W91-02339 5B

PULSA SOLAR: Solar Water Oscillation Pumps for Village Hydraulics.
W91-02347 5F

Problems of Maintenance of Water Quality in Arid and Semi-Arid Regions of West Africa.
W91-02348 5G

Arrival of a Generation of Field Expert Systems (L'Avenement d'une Generation de Systemes Expertes de Terrain).
W91-02354 7C

Systems Engineering Approach to Solutions of Drought in Developing Countries: The Case of Tanzania.
W91-02361 2A

Design and Management of Rural Water Supply Projects: Lessons Learned from Comparative Study of USAID Projects in Burkina Faso and Togo.
W91-02362 5F

Post Graduate Course in Hydrology and Hydrogeology (Formation Post-Universitaire en Hydrologie et Hydrogeologie).
W91-02363 6E

Hydrological Education at the AGRHYMET Centre (La Formation en Hydrologie au Centre AGRHYMET).
W91-02364 6E

Tapping of Water Holes from Temporary Surfaces to Improve Sahelian Pastureland Management (Exploitation de Points d'Eau de Surface Temporaires pour l'Amelioration de la Gestion des Paturages Saheliens).
W91-02366 3B

DIAGENESIS
Effects of Iron Cycling on Pb-210 Dating of Sediments in an Adirondack Lake, USA.
W91-02071 2J

DIATOMS
Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: I. 1,2,4-Trichlorobenzene.
W91-02436 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: II. 1,3,5-Trichlorobenzene.
W91-02437 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: III. 1,2,3-Trichlorobenzene.
W91-02438 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: IV. Pentachlorobenzene and Comparison with Trichlorobenzene Isomers.
W91-02439 5C

DIFFUSION
Tritium, Oxygen-18, and Deuterium Diffusion at the Confederation Road Landfill Site, Sarnia, Ontario, Canada.
W91-02146 5B

Diffusion and Dispersion in Coastal Waters.
W91-02521 5B

DIFFUSIVITY
Soil Water Diffusivity Determination by a Modified One-Step Outflow Method.
W91-02140 2G

DIGESTED SLUDGE
Heavy Metal Distribution in Anaerobic Sludges.
W91-02221 5D

Siting and Technology Pose Challenges for Communities Ending Ocean Disposal of Sludge.
W91-02955 5D

DIGESTER GAS
Digester Gas is Alternate Fuel.
W91-02764 5D

DIGITAL MAP DATA
Application of a Digital Geographic Data Base to Irrigation Water Rights Management.
W91-02598 6E

DIOXINS
Stage Specific Toxicity of 2,3,7,8-Tetrachlorodibenzo-p-Dioxin in Embryos of the Japanese Medaka (Oryzias latipes).
W91-02215 5C

Microcontaminants and Reproductive Impairment of the Forster's Tern on Green Bay, Lake Michigan-1983.
W91-02441 5C

DISCHARGE CAPACITY
Towards a Regional Water Resource Study of Arid and Semi-arid Africa.
W91-02295 2A

DISCHARGE MEASUREMENT
Velocity-Discharge Relationships in Three Lowland Rivers.
W91-02807 7B

DISCRIMINANT ANALYSIS
Estimating Erosion Risk on Forest Lands Using Improved Methods of Discriminant Analysis.
W91-02181 2J

DISINFECTION
Toxicological Risk/Benefit-Aspects of Drinking Water Chlorination and of Alternative Disinfection Procedures.
W91-02547 5F

Structure of an Anhydride Related to a Mutagenic Component of Drinking Water, 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone.
W91-02551 5A

Modeling Inactivation of Giardia lamblia.
W91-02570 5F

Guidance Manual for Compliance with the Filtration and Disinfection Requirements for Public Water Systems Using Surface Water Sources.
W91-02623 5F

Wastewater Treatment: Ozonation Processes and Equipment (Jan 77-Apr 90). Citations from the Selected Water Resources Abstracts Database.
W91-02667 5D

Inactivation of Bacteriophage MS2 in Wastewater Effluent with Monochromatic and Polychromatic Ultraviolet Light.
W91-02795 5D

Secondary Disinfection of Service Reservoirs.
W91-02846 5F

Evolution of an Ozone Process at Littleton Water-Treatment Works.
W91-02849 5F

DISPERSION
Universal Scaling of Hydraulic Conductivities and Dispersivities in Geologic Media.
W91-02183 2F

Diffusion and Dispersion in Coastal Waters.
W91-02521 5B

Analytical Solution for One-Dimensional Transport in Heterogeneous Porous Media.
W91-02863 5F

Apparent Dispersion in Transient Groundwater Flow.
W91-02864 2F

Application of the Arnoldi Algorithm to the Solution of the Advection-Dispersion Equation
W91-02883 5F

DISPERSIVITY
Universal Scaling of Hydraulic Conductivities and Dispersivities in Geologic Media.
W91-02183 2

DISPOSAL SITES
Guidelines for Physical and Biological Monitoring of Aquatic Dredged Material Disposal Site
W91-02607 5

DISSOLVED ORGANIC CARBON
Hydrogeochemical Processes Controlling the Transport of Dissolved Organic Carbon Through a Forested Hillslope.
W91-02159 5

Soil Water in the Riparian Zone as a Source of Carbon for a Headwater Stream.
W91-02747 2

Seasonal Changes in Iron Transport and Nature of Dissolved Organic Matter in a Humic River in Northern Finland.
W91-02810 2

DISSOLVED OXYGEN
Distribution of California Stream Fishes: Influence of Environmental Temperature and Hypoxia.
W91-02518 2

Accurate Method for Calculation of Saturated DO.
W91-02577

DISSOLVED SOLIDS
Seasonal Changes in Iron Transport and Nature of Dissolved Organic Matter in a Humic River in Northern Finland.
W91-02810 2K

DISTRIBUTION PATTERNS
Southwestern Riparian Plant Communities: Site Characteristics, Tree Species Distributions, and Size-class Structures.
W91-02491 2H

DISTRICT OF COLUMBIA
Two Decades of Progress.
W91-02957 5G

DIURNAL DISTRIBUTION
Tidal and Turbidity Effects on the Shallow-Water Fish Assemblage of Kuwait Bay.
W91-02126 2L

DIURNAL VARIATION
Reciprocal Diel Vertical Migration Behavior in Planktivores and Zooplankton in British Columbia Lakes.
W91-02067 2H

DNA
Decontamination Technologies for Release from Bioprocessing Facilities: Part V. Decontamination of Sludge.
W91-02936 5D

Decontamination Technologies for Release from Bioprocessing Facilities: Part VI. Verification of Wastewater Decontamination.
W91-02937 5D

DOMESTIC WASTES
Vulnerability of the Brazzaville Aquifer and the Risk of Contamination with Domestic Wastes (Problemes de Vulnerabilite de la Nappe de Brazzaville et Risques de Contamination par les Rejets Domestiques).
W91-02339 5B

DOMESTIC WATER
Impact of Handpump Corrosion on Water Quality.
W91-02338 5F

Water Conservation in Drought-Stricken Santa Barbara County--Response Is Slow.
W91-02423 3D

DOSE-RESPONSE RELATIONSHIPS
Influence of Physiological Condition on Cadmium Transport from Haemolymph to Hepatopancreas in Carcinus maenas.
W91-02124 5B

DRAINAGE
Hydraulic Properties of Four Soils in Niger and Implications for Water Balance Studies.
W91-02330 2G

DRAINAGE EFFECTS
Wetlands and Groundwater: New Constraints in Groundwater Management.
W91-02722 6G

DRAINAGE ENGINEERING
Groundwater Management by a Dual-Pipe Subirrigation System.
W91-02677 4B

DRAINAGE PATTERNS
Watershed Delineation with Triangle-Based Terrain Models.
W91-02525 2E

DRAINAGE SYSTEMS
New Approach for Optimization of Urban Drainage Systems.
W91-02575 5D

DREDGING
Evaluation of the Nutting Lake Dredging Program.
W91-02617 5G

DREDGING WASTES
Toxicity Testing of Sublethal Effects of Dredged Materials.
W91-02461 5C

Guidelines for Physical and Biological Monitoring of Aquatic Dredged Material Disposal Sites.
W91-02607 5A

Evaluation of Loading and Dredged Material Overflow from Mechanically Filled Hopper Barges in Mobile Bay, Alabama.
W91-02609 5E

DRINKING WATER
Residues of DDT and HCH in Major Sources of Drinking Water in Bhopal, India.
W91-02099 5B

Water Quality in the Sance Reservoir (North Moravia).
W91-02392 5G

Relating Empirical Water Quality Diagrams and Plankton-Dynamical Models: The SAMPLE Methodology Applied to a Drinking Water Storage Reservoir.
W91-02395 5F

Water Treatment Problems.
W91-02400 5F

Groundwater Monitoring: Volatile Organic Chemicals Beneath Unsewered Subdivision.
W91-02413 5B

Drinking Water Contamination and the Incidence of Leukemia: An Ecologic Study.
W91-02509 5C

Evaluating the Impact of Municipal Water Fluoridation on the Aquatic Environment.
W91-02510 5C

Leukemia Incidence and Radioactivity in Drinking Water in 59 Iowa Towns.
W91-02511 5C

Binding of Triazine Herbicides to Antibodies in Anhydrous Organic Solvents.
W91-02512 5A

Toxicological Risk/Benefit-Aspects of Drinking Water Chlorination and of Alternative Disinfection Procedures.
W91-02547 5F

Information Collection Request for: National Primary Drinking Water Regulations for Inorganic Chemicals.
W91-02602 7B

Technologies and Costs for the Treatment of Microbial Contaminants in Potable Water Supplies.
W91-02614 5F

Drinking Water Quality Standards and Standard Tests (Jan 72 - May 89). Citations from the Food Science and Technology Abstracts Database.
W91-02646 5F

Heavy Metals in Drinking Water: Standards, Sources, and Effects (Jan 78 - Sep 89). Citations from the Life Sciences Collection Database.
W91-02647 5F

Drinking Water Criteria Document for Toluene.
W91-02731 5G

Drinking Water Criteria Document for 2(2,4,5-Trichlorophenoxy) Propionic Acid (2,4,5-TP).
W91-02732 5G

Drinking Water Criteria Document for Toxaphene.
W91-02733 5G

Adaptation of a Lead-testing Program.
W91-02765 5A

Large-Scale Biological Nitrate and Ammonia Removal.
W91-02843 5F

Evolution of an Ozone Process at Littleton Water-Treatment Works.
W91-02849 5F

Hydrogeologic Assessment of Exposure to Solvent-Contaminated Drinking Water: Pregnancy Outcomes in Relation to Exposure.
W91-02935 5C

Aluminium Deposition in Bone After Contamination of Drinking Water Supply.
W91-02951 5C

DROUGHT
Estimated Demand for Agricultural Water for Use in New Jersey, 1990.
W91-02246 6D

Development of Theoretical Hydrology in West Africa (Developpement de l'Hydrologie Theorique en Afrique de l'Ouest).
W91-02289 2A

Water Losses in the Nile Basin.
W91-02298 2A

Analysis of Drought in Ethiopia Based on Nile River Flow Records.
W91-02299 2A

Impact of Hydrology on Hydraulic Projects in Burkina (Impact de l'Hydrologie sur les Projets Hydrauliques au Burkina).
W91-02360 6G

Systems Engineering Approach to Solutions of Drought in Developing Countries: The Case of Tanzania.
W91-02361 2A

Impact of Climatic Changes on Surface Water Resources in West and Central Africa (Impact des Changements Climatiques sur les Ressources en Eau de Surface en Afrique de l'Ouest et Centrale: L'Experience de l'OSTROM).
W91-02368 7A

Hydrological Aspects of the Development and Rapid Decay of the 1989 Drought.
W91-02428 2B

Acid Depositions, Summer Droughts, Forest Decline: Development of the Nitrous Acid Hypothesis.
W91-02828 5C

DROUGHT EFFECTS
Drought in France in 1989 (La Secheresse de 1989).
W91-02048 2B

Foundation Problems in Champlain Clays During Droughts. I: Rainfall Deficits in Montreal (1930-1988).
W91-02147 8D

DROUGHT RESISTANCE
Screening for Drought Tolerance: Soybean Germination and Its Relationship to Seedling Responses.
W91-02074 3F

Influence of Plant Water Stress on Net Photosynthesis and Leaf Area of Two Maize (Zea mays L.) Cultivars.
W91-02075 3F

DRY FARMING
Quantifying the Water Balance of Dryland Millet in Niger Using State of the Art Evaporation Techniques.
W91-02316 3F

DUCKS
Avoidance of Selenium-Treated Food by Mallards.
W91-02214 5C

DUNES
Runoff Generation in a Sandy Area--The Nizzana Sands, Western Negev, Israel.
W91-02811 2A

Nourishment of Perched Sand Dunes and the Issue of Erosion Control in the Great Lakes.
W91-02821 2J

DYES
North Carolina Plant Solves Textile-Wastewater Problems.
W91-02562 5D

EARTH TIDES
Response of the Water Level in a Well to Earth Tides and Atmospheric Loading Under Unconfined Conditions.
W91-02188 2F

EARTHQUAKE ENGINEERING
Simulation of Downhole and Crosshole Seismic Tests on Sand Using the Hydraulic Gradient Similitude Method.
W91-02939 7B

EARTHQUAKE FLOOD
Woody Plant Succession on Earthquake-Uplifted Coastal Wetlands of the Copper River Delta, Alaska.
W91-02498 2H

ECHINODERMS
Evaluation of the Sea Urchin Echinometra Iucunter as an Indicator of Heavy-Metal Contamination in Cuba (Evaluacion del Erizo de Mar Echinometra Iucunter como Indicator de Contaminacion por Metales Pesados, Cuba).
W91-02044 5A

Monthly Variations of Dissolved Free Amino Acids (DFAA) Observed in the Bay of Villefranche-sur-Mer, France: Experimental Study on Their Uptake by Paracentrotus lividus and Sphaerechinus granularis Larvae (Variations Mensuelles des Acides Amines Libres Dissous (AALD) Presents en un Point de la rade de Villefranche-sur-Mer: Utilisation par les Larves de Paracentrotus lividus et de Sphaerechinus granularis).
W91-02047 2L

ECOLOGICAL DISTRIBUTION
Spatial Organization and Population Density of the Fish Community of the Litter Banks within a Central Amazonian Blackwater Stream.
W91-02414 2H

ECOLOGICAL EFFECTS
Ecology of a Southern Ohio Stream Receiving Fly Ash Pond Discharge: Changes from Acid Mine Drainage Conditions.
W91-02208 5C

Identification and Inventory of Philippine Forested-Wetland Resource.
W91-02473 2H

Mangrove Forest Resources in Indonesia.
W91-02474 2H

Status and Distribution of Forested Wetlands in Tropical South America.
W91-02477 2H

Status and Trends of U.S. Wetlands and Deepwater Habitats.
W91-02483 4C

Estimating the Forested-Wetland Resource in the Southeastern United States with Forest Survy Data.
W91-02484 4C

Approach to the Inventory of Forested Wetlands for Timber-Harvesting Impact Assessment.
W91-02485 4C

Possible Effects of Residential Development on Streamflow, Riparian Plant Communities, and Fisheries on Small Mountain Streams in Central Arizona.
W91-02493 4C

Long-Term Trends in the Bald-Cypress (Taxodium distichum) Resource in Louisiana (U.S.A).
W91-02501 2H

Dependence of Estuarine Productivity on Anomalies in Mean Sea Level.
W91-02590 2L

Multiple Demands on Wetlands.
W91-02779 2H

Recovery of Lotic Periphyton Communities after Disturbance.
W91-02899 2H

Physical Habitat Template of Lotic Systems: Recovery in the Context of Historical Pattern of Spatiotemporal Heterogeneity.
W91-02902 2H

Disturbance Regimes, Resilience, and Recovery of Animal Communities and Habitats in Lotic Ecosystems.
W91-02903 2H

Disturbance and Recovery of Large Floodplain Rivers.
W91-02907 2H

Island Biogeographical Theory: Can It Be Used to Predict Lotic Recovery Rates.
W91-02910 2E

Application of Ecological Theory to Determining Recovery Potential of Disturbed Lotic Ecosystems: Research Needs and Priorities.
W91-02911 2H

ECOLOGY
Summary of Biological Investigations Relating to Surface-Water Quality in the Kentucky River Basin, Kentucky.
W91-02232 5C

Present Situation of the European Floodplain Forests.
W91-02471 4C

Ecology of Water-Filled Treeholes in Australian Rainforests: Food Web Reassembly as a Measure of Community Recovery after Disturbance.
W91-02514 2H

Vegetation Change on the Ouse Washes Wetland, England, 1972-1988 and Effects on Their Conservation Importance.
W91-02515 2H

Assessment of Bank Slope as a Predictor of Conservation Status in River Corridors.
W91-02516 2H

Effects of Pool Size and Isolation on Amphibian Communities.
W91-02517 2H

Distribution of California Stream Fishes: Influence of Environmental Temperature and Hypoxia.
W91-02518 2H

Ecosystem Modelling: Science or Technology.
W91-02736 2H

ECONOMIC ASPECTS
Institutional Economics and Indian Water Projects-Does the Framework Make a Difference.
W91-02268 6A

Sliplining Rescues Sewers and a Small Budget.
W91-02424 8A

Feasibility Study on the Groundwater Development for the Water Supply of an Oil Shale Processing Plant in Central Jordan.
W91-02720 4B

Cost Supplement to Technologies and Costs for the Removal of Mercury from Potable Water Supplies.
W91-02725 5F

Cost Supplement to Technologies and Costs for the Removal of Nitrates and Nitrites from Potable Water Supplies.
W91-02726 5F

Cost Supplement to Technologies and Costs for the Removal of Chromium from Potable Water Supplies.
W91-02727 5F

Cost Supplement to Technologies and Costs for the Removal of Selenium from Potable Water Supplies.
W91-02728 5

Cost Supplement to Technologies and Costs for the Removal of Asbestos from Potable Water Supplies.
W91-02730 5

European Environmental Directives--Implications for Northern Ireland.
W91-02851 5

ECOSYSTEMS
Reciprocal Diel Vertical Migration Behavior of Planktivores and Zooplankton in British Columbia Lakes.
W91-02067 2

Measuring Epilithic Bacterial Production in Streams.
W91-02070 2

Ecology of a Southern Ohio Stream Receiving Fly Ash Pond Discharge: Changes from Acid Mine Drainage Conditions.
W91-02208

Ways of Evaluating Human-Induced Impacts on the Functioning of Waterbody Ecosystems.
W91-02397

Ecology of Water-Filled Treeholes in Australian Rainforests: Food Web Reassembly as a Measure of Community Recovery after Disturbance.
W91-02514

Vegetation Change on the Ouse Washes Wetland, England, 1972-1988 and Effects on Their Conservation Importance.
W91-02515

Assessment of Bank Slope as a Predictor of Conservation Status in River Corridors.
W91-02516

Effects of Pool Size and Isolation on Amphibian Communities.

Disturbance Regimes, Resilience, and Recovery of Animal Communities and Habitats in Lotic Ecosystems.
W91-02903 2H

Biogeochemical Cycling Constraints on Stream Ecosystem Recovery.
W91-02906 2H

Disturbance and Recovery of Large Floodplain Rivers.
W91-02907 2H

Application of Ecological Theory to Determining Recovery Potential of Disturbed Lotic Ecosystems: Research Needs and Priorities.
W91-02911 2H

State of the Chesapeake Bay.
W91-02956 5G

ECOTOXICOLOGY
Effects of Heavy Metals on Eels, Anguilla sp.
W91-02046 5C

EDDY DIFFUSION
Vertical Mixing in Uberlinger See, Western Part of Lake Constance.
W91-02450 2H

EDUCATION
Advances Towards Water Resources Development Through Hydrological Training and Education.
W91-02293 6E

Post Graduate Course in Hydrology and Hydrogeology (Formation Post-Universitaire en Hydrologie et Hydrogeologie).
W91-02363 6E

Hydrological Education at the AGRHYMET Centre (La Formation en Hydrologie au Centre AGRHYMET).
W91-02364 6E

EEL
Effects of Heavy Metals on Eels, Anguilla sp.
W91-02046 5C

Occurrence, Relative Abundance, and Size of Landlocked Sea Lamprey (Petromyzon marinus) Ammocoetes in Relation to Stream Characteristics in the Great Lakes.
W91-02068 2H

EFFLUENTS
Toxicity Evaluation of the Proposed Secondary and the Primary Effluents Discharged to Massachusetts Bay.
W91-02101 5B

Nutrients, Heavy Metals and Organic Micropollutants in an Eutrophic Brazilian Lagoon.
W91-02555 5B

EGGS
Predation on Amphibian Eggs and Tadpoles by Common Predators in Acidified Lakes.
W91-02407 5C

Chronic Toxicity of Copper to a Partial Life Cycle of the Midge, Chironomus decorus.
W91-02431 5C

Microcontaminants and Reproductive Impairment of the Forster's Tern on Green Bay, Lake Michigan-1983.
W91-02441 5C

EL NINO/SOUTHERN OSCILLATION
Precipitation Fluctuation over Semiarid Regions in Northern China and the Relationship with El Nino/Southern Oscillation.
W91-02446 2B

ELECTRIC CURRENTS
Some Characteristics of Point Discharge Current during Two Pre-Monsoon Season Thunderstorms at Pune.
W91-02553 2B

ELECTRIC POWER PRODUCTION
Development of Turkey's Electric Energy.
W91-02110 8C

ELECTRICAL EQUIPMENT
Field Frost Heave Measurement and Prediction During Periods of Seasonal Frost.
W91-02150 2C

ELECTRICAL PROPERTIES
Calibration of Time Domain Reflectometry for Water Content Measurement Using a Composite Dielectric Approach.
W91-02857 2G

ELECTRICAL WELL LOGGING
Combining Surface Geoelectrics and Borehole Measurements for Contamination Control.
W91-02685 5A

ELECTROLYSIS
Electrolytic Decomposition of Cyanide Effluent with an Electrochemical Reactor Packed with Stainless Steel Fiber.
W91-02784 5D

ELECTROLYTES
Effects of Water Acidity, Calcium, and Aluminum on Whole Body Ions of Brook Trout (Salvelinus fontinalis) Continuously Exposed from Fertilization to Swim-Up: A Study by Instrumental Neutron Activation Analysis.
W91-02104 5C

Whole Body Ions of Brook Trout (Salvelinus fontinalis) Alevins: Responses of Yolk-Sac and Swim-Up Stages to Water Acidity, Calcium, and Aluminum, and Recovery Effects.
W91-02105 5C

ELECTRON MICROSCOPY
Electron Microscopy Documenting the Cellular Metabolic Fate of Hg Ions.
W91-02171 5C

Electron Microscopy Documenting the Cellular Metabolic Fate of Zn Ions.
W91-02172 5C

ELECTRONIC EQUIPMENT
Using Programmable Logic Controllers.
W91-02566 5D

EMBANKMENTS
Study of Embankment Performance During Overtopping and Throughflow. Report 1: Feasibility Study.
W91-02603 8A

Study of Embankment Performance During Overtopping and Throughflow. Report 2: Hydraulic Study and Modeling of Models.
W91-02608 8B

Study of Embankment Performance During Overtopping and Throughflow. Report 3: Model-Prototype Comparison Studies.
W91-02610 8B

EMBRYONIC GROWTH STAGE
Methods for Assessing Fertilization and Embryonic/Larval Development in Toxicity Tests Using the California Mussel (Mytilus californianus).
W91-02212 5A

Stage Specific Toxicity of 2,3,7,8-Tetrachlorodibenzo-p-Dioxin in Embryos of the Japanese Medaka (Oryzias latipes).
W91-02215 5C

Chronic Toxicity of Copper to a Partial Life Cycle of the Midge, Chironomus decorus.
W91-02431 5C

EMERGENT AQUATIC PLANTS
Aquatic and Certain Wetland Vascular Vegetation of Reelfoot Lake, 1920s-1980s. IV. Seasonally Emergent Macrophytes.
W91-02582 2H

ENDRIN
Short-Term Lethality and Sediment Avoidance Assays with Endrin-Contaminated Sediment and Two Oligochaetes from Lake Michigan.
W91-02199 5C

Tigris-Euphrates Delta: A Major Source of Pesticides to the Shatt al-Arab River (Iraq).
W91-02463 5B

ENERGY CONVERSION
Energy Relations in Transient Closed-Conduit Flow.
W91-02522 8B

ENERGY COSTS
Energy-Efficient Municipal Sludge Incineration.
W91-02563 5E

ENERGY RECOVERY
Digester Gas is Alternate Fuel.
W91-02764 5D

ENERGY SOURCES
Digester Gas is Alternate Fuel.
W91-02764 5D

ENERGY TRANSFER
Diel and Seasonal Energy Transfer, Storage and Stratification in African Reservoirs and Lakes.
W91-02370 2H

ENGLAND
Trace Metals in the Severn Estuary: A Reappraisal.
W91-02557 5B

Gravel Extraction and Water Resources Management of the Denge Gravel Aquifer, Kent, England.
W91-02723 4C

ENRICHMENT
Eutrophication of Nigeria's Lake Asejire.
W91-02384 5C

ENTERIC BACTERIA
Thermophilic Campylobacters in Two Sewage Treatment Plants in Libya.
W91-02122 5D

Outbreak of Campylobacter Enteritis Associated with a Community Water Supply.
W91-02781 5C

Reductions of Enteric Microorganisms During Aerobic Sludge Digestion.
W91-02794 5D

ENTEROVIRUSES
Simple Membrane Filter Method to Concentrate and Enumerate Male-Specific RNA Coliphages.
W91-02416 5A

Reductions of Enteric Microorganisms During Aerobic Sludge Digestion.
W91-02794 5D

ENTROPY
Spatial Uniformity of Power and the Altitudinal Geometry of River Networks.
W91-02860 2E

ENVIRONMENT
Present Situation of the European Floodplain Forests.
W91-02471 4C

ENVIRONMENTAL DATA
Approximation of Confidence Limits on Sample Semivariograms from Single Realizations of Spatially Correlated Random Fields.
W91-02187 7C

ENVIRONMENTAL EFFECTS
Influence of Sediment Disturbance and Water Flow on the Growth of the Soft-Shell Clam, Mya arenaria L.
W91-02062 2L

Changes in Seasonal Succession of Phytoplankton Induced by the Storm-Surge Barrier in the Oosterschelde (S.W. Netherlands).
W91-02116 2L

Climate and Climatic Resources of Reservoirs.
W91-02373 2H

Evaluating the Impact of Municipal Water Fluoridation on the Aquatic Environment.
W91-02510 5C

Distribution of California Stream Fishes: Influence of Environmental Temperature and Hypoxia.
W91-02518 2H

Analytical Approach to Assessment of Long-Term Effects of Low Levels of Contaminants in the Marine Environment.
W91-02554 5A

Wetland Areas: Natural Water Treatment System (Jan 78 - Aug 89). Citations from the Pollution Abstracts Database.
W91-02642 5D

ENVIRONMENTAL ENGINEERING
Modeling Transient Substrate Loads in Completely Mixed Aeration Basins at Hydraulic Steady State.
W91-02822 5D

ENVIRONMENTAL GRADIENT
Annual and Longitudinal Changes in the Environmental Conditions in Three Consecutive Reservoirs of the Guadiana River (W. Spain).
W91-02372 2H

ENVIRONMENTAL IMPACT
Environmental and Agricultural Implications of Dam Construction in the Niger Valley of Mali.
W91-02359 6G

Ways of Evaluating Human-Induced Impacts on the Functioning of Waterbody Ecosystems.
W91-02397 4C

Educated Guesses: Health Risk Assessment in Environmental Impact Statements.
W91-02508 4C

Gravel Extraction and Water Resources Management of the Denge Gravel Aquifer, Kent, England.
W91-02723 4C

Groundwater Flow and Quality Studies in Szigetkoz Region, Northwest Hungary.
W91-02724 6G

Proposed Framework and Database for EIA Auditing.
W91-02950 7B

ENVIRONMENTAL IMPACT STATEMENT
Educated Guesses: Health Risk Assessment in Environmental Impact Statements.
W91-02508 4C

ENVIRONMENTAL POLICY
Educated Guesses: Health Risk Assessment in Environmental Impact Statements.
W91-02508 4C

Toxic-Substance Control for the Ohio River.
W91-02564 5G

Environmental Variation, Life History Attributes, and Community Structure in Stream Fishes: Implications for Environmental Management and Assessment.
W91-02901 2H

ENVIRONMENTAL PROTECTION
State Wetland Protection Legislation Affecting Forestry in the Northeastern United States.

Phosphorus Cycle and Its Significance in the Eutrophication of Lake Sevan.
W91-02376 5C

Prediction on Eutrophication of Reservoir Yuqiao.
W91-02383 5G

Eutrophication of Nigeria's Lake Asejire.
W91-02384 5C

Key Factors in Taste and Odour Problems for Municipal Water Works Using Surface Water Sources.
W91-02394 5F

Seasonal Delivery of the Particulate Forms of Phosphorus to Lake Geneva from the Upper Rhone River.
W91-02448 2H

Free Ammonia and Toxicity Criteria in a Polluted Urban Lake.
W91-02536 5B

Nutrients, Heavy Metals and Organic Micropollutants in an Eutrophic Brazilian Lagoon.
W91-02555 5B

Use of Kinetic Bioassay Procedure to Estimate Sulfate and Cysteine Concentrations in Sediment.
W91-02796 2H

Influence of Waste Waters from the City of Venice and the Hinterland on the Eutrophication of the Lagoon.
W91-02930 5C

EVAPORATION
Water Vapor Transport through a Flail-Chopped Corn Residue.
W91-02130 3F

Evaporation from Free Water Surfaces in the Sudano-Sahelian Climate (L'evaporation des nappes d'eau libre en climat soudano-sahelien).
W91-02300 2D

Quantifying the Water Balance of Dryland Millet in Niger Using State of the Art Evaporation Techniques.
W91-02316 3F

Hydrologic Regime under Natural Climatic Conditions in the Lateritic Soil of Burkina Faso (Regime Hydrique en Conditions Climatiques Naturelles d'un Sol Lateritique du Burkina Faso).
W91-02317 2G

Water Transfer in Porous Non-Saturated Rock and Aquifer Recharge in the Sudano-Sahelian Climate (Transfert d'Eau en Milieu Poreux non Sature Recharge des Nappes en Climat Soudano-Sahelien).
W91-02319 2F

EVAPORATION PONDS
Degradation of Pesticide Waste Taken from a Highly Contaminated Soil Evaporation Pit in California.
W91-02443 5G

EVAPOTRANSPIRATION
Simplified Method to Estimate Regional 24-h Evapotranspiration from Thermal Infrared Data.
W91-02129 2D

New Method to Determine Regional Evapotranspiration.
W91-02184 2D

Water Losses in the Nile Basin.
W91-02298 2A

Estimates of Evapotranspiration with a One- and Two-Layer Model of Heat Transfer over Partial Canopy Cover.
W91-02408 2D

Remote Sensing Applications for Consumptive Use (Evapotranspiration).
W91-02594 7B

Combined Simulation of Canopy Reflectance and Thermal Response for Estimating Evapotranspiration.
W91-02595 2D

Estimating Areal Evapotranspiration by Combining Remote and Ground-Based Data.
W91-02596 2D

Estimates of Consumptive Use and Evapotranspiration in Palo Verde Valley, California, 1981 and 1983.
W91-02597 2D

EVAPOTRANSPIRATION POTENTIAL
Foundation Problems in Champlain Clays During Droughts. I: Rainfall Deficits in Montreal (1930-1988).
W91-02147 8D

EXAMS 2 MODEL
EXAMS 2: Exposure Analysis Modeling System.
W91-02174 7B

EXPANSIVE CLAYS
Foundation Problems in Champlain Clays During Droughts. I: Rainfall Deficits in Montreal (1930-1988).
W91-02147 8D

EXPERIMENTAL DESIGN
Experimental Comparison of the Effects of Benthivorous Fish and Planktivorous Fish on Plankton Community Structure.
W91-02452 2H

Coupled Inverse Problems in Groundwater Modeling: 2. Identifiability and Experimental Design.
W91-02880 7C

EXPERT SYSTEMS
Predicting Concentrations of Consumer Product Chemicals in Estuaries.
W91-02211 5B

Arrival of a Generation of Field Expert Systems (L'Avenement d'une Generation de Systemes Expertes de Terrain).
W91-02354 7C

Potential for Expert Systems in Water Utility Operation and Management.
W91-02415 5F

Testing Expert System for Activated Sludge Process Control.
W91-02573 5D

FALLOUT
Glacial Mass Balance Determination in the Accumulation Zone by In situ Measurements of Tchernobyl Radioactivity (Determination du Bilan Glaciaire en Zone d'Accumulation par Mesure In Situ de la Radioactivite due a Tchernobyl).
W91-02052 2C

FARM WASTES
Possible Importance of Wind Aeration in Controlling Odours from Piggery Slurry Stored after Aerobic Treatment.
W91-02772 5D

FARMING
Access of Small and Marginal Farmers to Groundwater--A Field Study.
W91-02675 4B

FATE OF POLLUTANTS
Solute Transport Through Saturated Soils: A Study of the Physical Non-Equilibrium Model.
W91-02090 5B

Application of Two-Site/Two-Region Models for Studying Simultaneous Nonequilibrium Transport and Degradation of Pesticides.
W91-02132 5B

MESIP: Modelling Environmental Scenarios in Ponds.
W91-02176 7C

Modeling of Multicomponent Transport with Microbial Transformation in Groundwater: The Fuhrberg Case.
W91-02180 5B

Detection of Organophosphorus Pesticide Detoxifying Bacterial Colonies, Using UV-Photography of Parathion-Impregnated Filters.
W91-02200 5B

Slowly Reversible Sorption of Aliphatic Halocarbons in Soils. I. Formation of Residual Fractions.
W91-02209 5B

Slowly Reversible Sorption of Aliphatic Halocarbons in Soils. II. Mechanistic Aspects.
W91-02210 5B

Predicting Concentrations of Consumer Product Chemicals in Estuaries.
W91-02211 5B

Source, Extent, and Degradation of Herbicides in a Shallow Aquifer Near Hesston, Kansas.
W91-02252 5B

Persistence of DDT in the Yakima River Drainage, Washington.
W91-02457 5B

Persistence of Spilled Crude Oil in a Tropical Intertidal Environment.
W91-02556 5B

Sediment-Water-Equilibria: The Sorption of Volatile Chlorinated Hydrocarbons and Dichloro Benzenes by Sediments. (Sediment-Wasser-Gleichgewichte: Verhalten fluchtiger Chlorkohlenwasserstoffe und der Dichlorbenzole an Gewassersedimenten).
W91-02668 5B

Decomposition and Elimination of Typical Pollutants from Sanitary Landfills in Porous Aquifers.
W91-02693 5B

Coupling of Chemistry and Transport.
W91-02694 5B

Numerical Model for Simulating the In-situ Volatilization of Hydrocarbon Contaminants in Soils.
W91-02705 5B

Degradation of Vinyl Acetate by Soil, Sewage, Sludge, and the Newly Isolated Aerobic Bacterium V2.
W91-02769 5D

Transformation of Monoaromatic Hydrocarbons to Organic Acids in Anoxic Groundwater Environment.
W91-02818 5B

Determination of Photochemically Produced Hydroxyl Radicals in Seawater and Freshwater.
W91-02852 5A

Fate of Aldicarb in the Unsaturated Zone Beneath a Citrus Grove.
W91-02859 5B

FATTY ACIDS
Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: I. 1,2,4-Trichlorobenzene.
W91-02436 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: II. 1,3,5-Trichlorobenzene.
W91-02437 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: III. 1,2,3-Trichlorobenzene.
W91-02438 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: IV. Pentachlorobenzene and Comparison with Trichlorobenzene Isomers.
W91-02439 5C

FAUNA
Control of Meiobenthic Abundance by Macrofauna in a Subtidal Muddy Habitat.
W91-02127 2

FEDERAL JURISDICTION
Indian Water Claims Negotiations: Conflicting Federal Roles.
W91-02263 6

Indian Water Rights Settlements: The Role of Local Repayment and Operating Entities Responsible for Federal Reclamation Projects.
W91-02265 6

FENITROTHION
Response and Recovery of Brain Acetylcholinesterase Activity in Atlantic Salmon (Salmo salar) Exposed to Fenitrothion.
W91-02061 5

FENVALERATE
Short-Term Exposure of Zooplankton to the Synthetic Pyrethroid, Fenvalerate, and Its Effects on Rates of Filtration and Assimilation of the Alga, Chlamydomonas reinhardii.
W91-02195

FERTILIZERS
Sewage Sludge: Application to Soils (Jan 8 Jul 89). Citations from the BioBusiness Database.
W91-02643

FICKS LAW
Universal Scaling of Hydraulic Conductivities and Dispersivities in Geologic Media.
W91-02183

FILTRATION
Filtration/Adsorption Media for Bacteria Turbidity Removal.
W91-02579

Guidance Manual for Compliance with the tration and Disinfection Requirements for Public Water Systems Using Surface Water Sour
W91-02623

Ionic Strength in Deep Bed Filtration.
W91-02801

FINGER LAKES
Reconstruction and Dynamics of the Late Wisconsin 'Ontario' Ice Dome in the Finger Lakes Region, New York.
W91-02151

FINITE DIFFERENCE METHODS
Integrated Finite Difference Model for Groundwater Flow and Quality Simulation.
W91-02700

Modeling Channel Bed Transients Using Exact F-D Schemes.
W91-02918

FINITE ELEMENT METHOD
Analysis of Water Surface and Flow Distribution for the Design Flood at a Proposed Highway Crossing of the Sabine River Near Texas.
W91-02226

Interactive Groundwater Modelling: Graphics, ICAD and AI.
W91-02699

Finite Element Groundwater Model as Essential Planning Tool: Microbiological Denitrification of a Well Field at Broichhof.
W91-02703

Large-scale Floodplain Modelling.
W91-02808 2E

Analysis of Hydrologic Impact of Quarrying System by 3-D Finite Element Model.
W91-02921 4C

FINLAND
Fucus vesiculosus as an Indicator of Heavy Metal Availability in a Fish Farm Recipient in the Northern Baltic Sea.
W91-02560 5A

Seasonal Changes in Iron Transport and Nature of Dissolved Organic Matter in a Humic River in Northern Finland.
W91-02810 2K

FISH
Distribution of Shrimp and Fish By-Catch Assemblages in the Canadian Eastern Arctic in Relation in Water Circulation.
W91-02066 2L

Residues of Organochlorine Insecticides in Fish from Mahala Water Reservoir, Jaipur, India.
W91-02100 5B

Lake Acidification and Fisheries Project: Brook Trout (Salvelinus fontinalis) Early Life Stages.
W91-02102 5C

Effects of pH, Aluminum, and Calcium on Survival and Growth of Eggs and Fry of Brook Trout (Salvelinus fontinalis).
W91-02103 5C

Effects of Water Acidity, Calcium, and Aluminum on Whole Body Ions of Brook Trout (Salvelinus fontinalis) Continuously Exposed from Fertilization to Swim-Up: A Study by Instrumental Neutron Activation Analysis.
W91-02104 5C

Whole Body Ions of Brook Trout (Salvelinus fontinalis) Alevins: Responses of Yolk-Sac and Swim-Up Stages to Water Acidity, Calcium, and Aluminum, and Recovery Effects.
W91-02105 5C

Epidermal Response to pH, Aluminum, and Calcium Exposure in Brook Trout (Salvelinus fontinalis) Fry.
W91-02106 5C

Responses of Brook Trout (Salvelinus fontinalis) Fry to Fluctuating Acid, Aluminum, and Low Calcium Exposure.
W91-02107 5C

Inorganic Monomeric Aluminum and pH as Predictors of Acidic Water Toxicity to Brook Trout (Salvelinus fontinalis).
W91-02108 5C

Aluminum and Acid Toxicity to Two Strains of Brook Trout (Salvelinus fontinalis).
W91-02109 5C

Factors Influencing Community Structure and Distribution of Different Life-Cycle Categories of Fishes in Shallow Waters of a Large Australian Estuary.
W91-02123 2L

Tidal and Turbidity Effects on the Shallow-Water Fish Assemblage of Kuwait Bay.
W91-02126 2L

Residue Levels of Organochlorine Chemicals and Polychlorinated Biphenyls in Fish from the Alexandria Region, Egypt.
W91-02197 5B

Stage Specific Toxicity of 2,3,7,8-Tetrachlorodibenzo-p-Dioxin in Embryos of the Japanese Medaka (Oryzias latipes).
W91-02215 5C

Mercury Accumulation in Relation to Size and Age of Atlantic Herring (Clupea harengus harengus) from the Southwestern Bay of Fundy, Canada.
W91-02433 5B

Skeletal Deformities in Smallmouth Bass, Micropterus dolomieui, from Southern Appalachian Reservoirs.
W91-02440 5C

Persistence of DDT in the Yakima River Drainage, Washington.
W91-02457 5B

Histopathology of Rainbow Trout Exposed to a Bleached Kraft Pulp Mill Effluent.
W91-02459 5C

Distribution of California Stream Fishes: Influence of Environmental Temperature and Hypoxia.
W91-02518 2H

FISH BEHAVIOR
Reciprocal Diel Vertical Migration Behavior in Planktivores and Zooplankton in British Columbia Lakes.
W91-02067 2H

Experimental Comparison of the Effects of Benthivorous Fish and Planktivorous Fish on Plankton Community Structure.
W91-02452 2H

Field Study of the Effects of Water Temperature, Discharge and Trout Odour on the Drift of Stream Invertebrates.
W91-02454 2H

Method for the Quantitative Evaluation of Fish Movements in Salt Ponds by Acoustic Telemetry.
W91-02782 7B

FISH DIETS
Experimental Comparison of the Effects of Benthivorous Fish and Planktivorous Fish on Plankton Community Structure.
W91-02452 2H

FISH DISEASES
Effects of Pulp Mill Effluents on Vertebrae of Fourhorn Sculpin, Myoxocephalus quadricornis, Bleak, Alburnus alburnus, and Perch, Perca fluviatilis.
W91-02468 5C

FISH FARMING
Influence of Cage Rearing Pisciculture on Water Quality and Bottom Sediments in Artificial Lakes.
W91-02393 5C

Fucus vesiculosus as an Indicator of Heavy Metal Availability in a Fish Farm Recipient in the Northern Baltic Sea.
W91-02560 5A

FISH FOOD ORGANISMS
Fry Communities as a Biomanipulating Tool in a Temperate Lowland Reservoir.
W91-02381 2H

FISH GUIDING
Turbine-Intake Fish-Diversion System.

FISH STOCKING

Reversal of Stream Acidification at the Birkenes Catchment, Southern Norway: Predictions Based on Potential ANC Changes.
W91-02739 5B

FISHERIES

Salmon and the Snake: Meeting Fish Flow Objectives in a Semi-Arid River Basin.
W91-02279 6D

Possible Effects of Residential Development on Streamflow, Riparian Plant Communities, and Fisheries on Small Mountain Streams in Central Arizona.
W91-02493 4C

FISHKILL

Occurrence, Relative Abundance, and Size of Landlocked Sea Lamprey (Petromyzon marinus) Ammocoetes in Relation to Stream Characteristics in the Great Lakes.
W91-02068 2H

FIXED BED ADSORPTION

Simplified Optimisation Procedure for Fixed Bed Adsorption Systems.
W91-02081 5D

FJORDS

Glaciomarine Sedimentation in Disraeli Fjiord, High Arctic Canada.
W91-02929 2J

FLAGELLATES

Degradation of Blue Green Alga, Microcystis Aeruginosa by Flagellata, Monas Guttula.
W91-02826 5F

FLASH EVAPORATION

Recovery of Mineral Salts and Potable Water from Desalting Plant Effluents by Evaporation. Part II. Proposed Simulation System for Salt Recovery.
W91-02402 3A

FLASH FLOODS

Potential Hazards from Floodflows in Grapevine Canyon, Death Valley National Monument, California and Nevada.
W91-02230 2E

FLOCCULATION

Effect of Charge Density and Molecular Mass of Cationic Polymers on Flocculation Kinetics in Aqueous Solution.
W91-02145 5F

FLOOD CHANNELS

Flood Dynamics of a Concrete-lined, Urban Stream in Kansas City, Missouri.
W91-02809 4C

FLOOD DISCHARGE

Frequency-Related Temporally and Spatially Varied Rainfall.
W91-02524 2B

Flood Dynamics of a Concrete-lined, Urban Stream in Kansas City, Missouri.
W91-02809 4C

FLOOD FLOW

Potential Hazards from Floodflows in Grapevine Canyon, Death Valley National Monument, California and Nevada.
W91-02230 2E

Disturbance and Recovery of Large Floodplain Rivers.
W91-02907 2H

FLOOD FORECASTING

Predetermination of Floods in Small Sahelian Basins under 10 Square Kilometers (La Predeterminatione des Crues sur des Petits Bassins Saheliens Inferieurs a 10 km2).
W91-02305 2E

Unit Hydrograph Technique Applied to Sahelian Flood Modeling: Comparison of Different Identification Methods (L'Hydrogramme Unitaire Applique a l'Analyse des Crues au Sahel: Comparaison de Differentes Methodes d'Identification).
W91-02309 2E

Analysis of the Speed of Propagation of Flood Waves (Analyse de la Vitesse de Propagation des Ondes de Crues).
W91-02311 2E

Large-scale Floodplain Modelling.
W91-02808 2E

Evaluation of Regional Flood Frequency Analysis with a Region of Influence Approach.
W91-02856 2E

FLOOD FREQUENCY

Potential Hazards from Floodflows in Grapevine Canyon, Death Valley National Monument, California and Nevada.
W91-02230 2E

Improved Methods for Regional Flood Frequency Analysis.
W91-02243 2E

Evaluation of Regional Flood Frequency Analysis with a Region of Influence Approach.
W91-02856 2E

FLOOD HYDROGRAPHS

General Characteristics of Surface Hydrology in Arid and Semi-arid Areas of Africa and Their Consequences for Development (Caracteres Generaux de l'Hydrologie Superficielle des Zones Arides et Semi-Arides en Afrique: Leurs Consequences sur les Etudes des Ingenieurs).
W91-02290 2E

Unit Hydrograph Technique Applied to Sahelian Flood Modeling: Comparison of Different Identification Methods (L'Hydrogramme Unitaire Applique a l'Analyse des Crues au Sahel: Comparaison de Differentes Methodes d'Identification).
W91-02309 2E

FLOOD PEAK

Predetermination of Floods in Small Sahelian Basins under 10 Square Kilometers (La Predeterminatione des Crues sur des Petits Bassins Saheliens Inferieurs a 10 km2).
W91-02305 2E

FLOOD PLAIN FORESTS

Present Situation of the European Floodplain Forests.
W91-02471 4C

Possibilities for Regeneration of Floodplain Forests within the Framework of the Flood-Protection Measures on the Upper Rhine, West Germany.
W91-02472 4A

Venezuelan Floodplain Study on the Orinoco River.
W91-02478 2

FLOOD PLAIN MANAGEMENT

Hydraulic Working of Shallow Waters in W
Africa (Fonctionnement Hydrologique des E
Fonds en Afrique de l'Ouest).
W91-02314 4

Possibilities for Regeneration of Floodplain F
ests within the Framework of the Flood-Prot
tion Measures on the Upper Rhine, West G
many.
W91-02472

FLOOD PLAINS

Present Situation of the European Floodpl
Forests.
W91-02471

Venezuelan Floodplain Study on the Orin
River.
W91-02478

Fluvial Dynamics and Succession in the Lo
Ucayali River Basin, Peruvian Amazonia.
W91-02480

Southwestern Riparian Plant Communities:
Characteristics, Tree Species Distributions,
Size-class Structures.
W91-02491

Large-scale Floodplain Modelling.
W91-02808

Seasonal Dynamics in Methane Emissions
the Amazon River Floodplain to the Tr
sphere.
W91-02834

Methane Flux from the Amazon River Fl
plain: Emissions During Rising Water.
W91-02837

Disturbance and Recovery of Large Flood
Rivers.
W91-02907

FLOOD RECURRENCE INTERVAL

Potential Hazards from Floodflows in G
vine Canyon, Death Valley National Monu
California and Nevada.
W91-02230

Floods of February 1989 in Tennessee.
W91-02260

FLOOD WAVES

Analysis of the Speed of Propagation of
Waves (Analyse de la Vitesse de Propa
des Ondes de Crues).
W91-02311

FLOODING

Geographical Aspects of Forested Wetla
the Lower Ucayali, Peruvian Amazonia.
W91-02481

Palm Communities in Wetland Forest E
tems of Peruvian Amazonia.
W91-02482

Growth and Development of Bald-Cy
Water-Tupelo Stands under Continuous
Seasonal Flooding.
W91-02499

Comparative Study of the Response of
dium distichum and Nyssa aquatica Seedl
Soil Anaerobiosis and Salinity.
W91-02500

Large-scale Floodplain Modelling.
W91-02808

FLOODS
Floods of 1987 in the Glacial Basins Situated in Pennine Alps in Switzerland (Les Crues de l'ete 1987 dans les Bassins Versants Glaciaires des Alps Pennines).
W91-02049 2E

Floods of February 1989 in Tennessee.
W91-02260 4A

General Characteristics of Surface Hydrology in Arid and Semi-arid Areas of Africa and Their Consequences for Development (Caracteres Generaux de l'Hydrologie Superficielle des Zones Arides et Semi-Arides en Afrique: Leurs Consequences sur les Etudes des Ingenieurs).
W91-02290 2E

Predetermination of Floods in Small Sahelian Basins under 10 Square Kilometers (La Predeterminatione des Crues sur des Petits Bassins Saheliens Inferieurs a 10 km2).
W91-02305 2E

Unit Hydrograph Technique Applied to Sahelian Flood Modeling: Comparison of Different Identification Methods (L'Hydrogramme Unitaire Applique a l'Analyse des Crues au Sahel: Comparaison de Differentes Methodes d'Identification).
W91-02309 2E

Analysis of the Speed of Propagation of Flood Waves (Analyse de la Vitesse de Propagation des Ondes de Crues).
W91-02311 2E

Hydraulic Working of Shallow Waters in West Africa (Fonctionnement Hydrologique des Bas Fonds en Afrique de l'Ouest).
W91-02314 4A

Scientific and Technical Evaluation of Mathematical Models in the Planning Design and Operation of Hydrosystems in Africa.
W91-02350 2E

Hydrology and River Control on the Niger and Senegal.
W91-02358 2E

Flooding and Saltwater Intrusion: Potential Effects on Survival and Productivity of Wetland Forests Along the U.S. Gulf Coast.
W91-02489 4C

FLORENCE
Microbial Quality of the Water in the Distribution System of Florence.
W91-02144 5F

FLORIDA
Surface-Water Hydrology and Salinity of the Anclote River Estuary, Florida.
W91-02229 2E

Bibliography of U.S. Geological Survey Reports on the Water Resources of Florida, 1886-1989.
W91-02237 10C

Water Resources Data for Florida, Water Year 1989, Volume 3B: Southwest Florida Ground Water.
W91-02240 7C

Florida Seminole Indian Dispute Settlement Including Water Rights Compact and Manual.
W91-02276 6E

Water Resources for Florida, Water Year 1989, Volume 2A. South Florida - Surface Water.
W91-02625 7C

Water Resources Data for Florida, Water Year 1989, Volume 2B. South Florida - Ground Water.
W91-02626 7C

Water Resources Data for Florida, Water Year 1989, Volume 3A: Southwest Florida Surface Water.
W91-02627 7C

Commitment to Monitoring and Sampling.
W91-02763 5D

Fate of Aldicarb in the Unsaturated Zone Beneath a Citrus Grove.
W91-02859 5B

FLOW AROUND OBJECTS
Controlling Mechanism of Local Scouring.
W91-02523 2J

FLOW AUGMENTATION
Hydrology and River Control on the Niger and Senegal.
W91-02358 2E

FLOW CONTROL
Potential for Enhancing Riparian Habitats in the Southwestern United States with Watershed Practices.
W91-02495 4A

FLOW DISCHARGE
Influence of Sediment Disturbance and Water Flow on the Growth of the Soft-Shell Clam, Mya arenaria L.
W91-02062 2L

Velocity-Discharge Relationships in Three Lowland Rivers.
W91-02807 7B

FLOW MEASUREMENT
Effects of Flow Disturbances on the Accuracy of Turbine-Type Water Meters.
W91-02143 7B

FLOW MODELS
Curious Behavior of a Groundwater Flow Model.
W91-02190 2F

Analysis of Water Surface and Flow Distribution for the Design Flood at a Proposed Highway Crossing of the Sabine River Near Tatum, Texas.
W91-02226 2E

Watershed Delineation with Triangle-Based Terrain Models.
W91-02525 2E

Distribution of Aquifer Recharge from a Circular Spreading Basin under Transient Operations.
W91-02678 4B

Modeling of Variable Density Flow, Application to the Management of Coastal Aquifers (Modelisation des Ecoulements a Densite Variable, Application a l'Exploitation des Aquiferes Cotiers).
W91-02706 2F

Modelling of Flow and Contaminant Transport in a Conjunctively Managed Groundwater Basin: A Case Study.
W91-02707 5B

Bed Configurations in Steady Unidirectional Water Flows: Part I. Scale Model Study Using Fine Sands.
W91-02925 2E

Bed Configurations in Steady Unidirectional Water Flows: Part II. Synthesis of Flume Data.
W91-02926 2E

Bed Configurations in Steady Unidirectional Water Flows: Part III. Effects of Temperature and Gravity.
W91-02927 2E

Flume Experiments on the Transport of Heavy Minerals in Gravel-Bed Streams.
W91-02928 2J

FLOW PATTERN
Watershed Delineation with Triangle-Based Terrain Models.
W91-02525 2E

FLOW PROFILES
Study of Embankment Performance During Overtopping and Throughflow. Report 1: Feasibility Study.
W91-02603 8A

FLOW RATES
Energy Relations in Transient Closed-Conduit Flow.
W91-02522 8B

Water Resources Data for Texas, Water Year 1989. Volume 3: Colorado River, Lavaca River, Guadalupe River, Nueces River, Rio Grande Basins and Intervening Coastal Basins.
W91-02640 7C

Spatial Uniformity of Power and the Altitudinal Geometry of River Networks.
W91-02860 2E

FLOW RESISTANCE
Estimation of Flow through and over Armored Slopes.
W91-02526 5E

Resistance to Flow in Steep Rough Streams.
W91-02920 2E

FLOW VELOCITY
Velocity-Discharge Relationships in Three Lowland Rivers.
W91-02807 7B

FLUID DROPS
Water-Drop Kinetic Energy Effect on Infiltration in Sodium-Calcium-Magnesium Soils.
W91-02135 2G

Water Droplet Energy and Soil Amendments: Effect on Infiltration and Erosion.
W91-02136 2G

FLUID FLOW
Flow to a Heated Borehole in Porous, Thermoelastic Rock: Analysis.
W91-02185 2F

Comparison of Darcian Flow in Corresponding Flat and Folded Surfaces.
W91-02186 2F

FLUID MECHANICS
Fluid Behavior/Waste Management in Low-Gravity Environments.
W91-02565 5D

FLUIDIZED BED PROCESS
Application of the Anaerobic Fluidized Bed Reactor for the Biological Wastewater Treatment at Low Temperatures (Anwendung des Anaeroben Fliessbettreaktors in der Biologischen Abwasserreinigung bei Niedrigen Temperaturen).
W91-02058 5D

FLUIDIZED BEDS
Kinetic Study on Methanogenesis by Attached Biomass in a Fluidized Bed.
W91-02792 5D

FLUMES
Flume Experiments on the Transport of Heavy Minerals in Gravel-Bed Streams.
W91-02928 2J

FLUORESCENCE
Soluble Fluorescence: Effects on Chlorophyll Determination at Different Salinities.
W91-02065 2L

FLUORIDATION
Evaluating the Impact of Municipal Water Fluoridation on the Aquatic Environment.
W91-02510 5C

FLUORIDES
Evaluating the Impact of Municipal Water Fluoridation on the Aquatic Environment.
W91-02510 5C

FLUVIAL SEDIMENTS
Fluvial Dynamics and Succession in the Lower Ucayali River Basin, Peruvian Amazonia.
W91-02480 2E

FLY ASH
Ecology of a Southern Ohio Stream Receiving Fly Ash Pond Discharge: Changes from Acid Mine Drainage Conditions.
W91-02208 5C

FOAMING
Characterization of Activated Sludge Foams from Two Plants.
W91-02578 5D

FOOD CHAINS
Micrograzer Impact and Substrate Limitation of Bacterioplankton in Lake Michigan.
W91-02072 2H

Large-Lake Responses to Declines in the Abundance of a Major Fish Planktivore--The Lake Michigan Example.
W91-02073 2H

Carbon Budgets of the Microbial Food Web in Estuarine Enclosures.
W91-02125 2L

Long-term Relationships Between Phyto- and Zooplankton in the Meso-Eutrophic Reservoir Saidenbach.
W91-02380 2H

DDT Contamination of Benthic Macroinvertebrates and Sediments from Tributaries of Wheeler Reservoir, Alabama.
W91-02442 5B

Foodweb Response to the Experimental Manipulation of a Benthivore (Cyprinus carpio), Zooplanktivore (Menidia beryllina) and Benthic Insects.
W91-02453 2H

Polychlorinated Biphenyl Congeners in Sediments, Plankton, Molluscs, Crustaceans, and Eel in a Freshwater Lake: Implications of Using Reference Chemicals and Indicator Organisms in Bioaccumulation Studies.
W91-02465 5B

Ecology of Water-Filled Treeholes in Australian Rainforests: Food Web Reassembly as a Measure of Community Recovery after Disturbance.
W91-02514 2H

FOOD HABITS
Avoidance of Selenium-Treated Food by Mallards.
W91-02214 5C

Fry Communities as a Biomanipulating Tool in a Temperate Lowland Reservoir.
W91-02381 2H

FOOD PROCESSING INDUSTRY
Safety and Efficacy of Food Processing Sludges as Animal Feed: Chemical Characterization.
W91-02542 5E

FOOD-PROCESSING WASTES
Acute Toxicity of Heavy Metals to Aerobic Digestion of Waste Cheese Whey.
W91-02776 5D

FORECASTING
Low Flow Estimation Based on River Recession Rate.
W91-02847 2E

FOREIGN RESEARCH
Water Research in Australia: Current Projects 1989.
W91-02612 9D

FOREST ECOSYSTEMS
Present Situation of the European Floodplain Forests.
W91-02471 4C

Identification and Inventory of Philippine Forested-Wetland Resource.
W91-02473 2H

Status and Distribution of Forested Wetlands in Tropical South America.
W91-02477 2H

Venezuelan Floodplain Study on the Orinoco River.
W91-02478 2H

Wetland and Upland Forest Ecosystems in Peruvian Amazonia: Plant Species Diversity in the Light of Some Geological and Botanical Evidence.
W91-02479 2H

Fluvial Dynamics and Succession in the Lower Ucayali River Basin, Peruvian Amazonia.
W91-02480 2E

Geographical Aspects of Forested Wetlands in the Lower Ucayali, Peruvian Amazonia.
W91-02481 2H

Palm Communities in Wetland Forest Ecosystems of Peruvian Amazonia.
W91-02482 2H

Estimating the Forested-Wetland Resource in the Southeastern United States with Forest Survy Data.
W91-02484 4C

Approach to the Inventory of Forested Wetlands for Timber-Harvesting Impact Assessment.
W91-02485 4C

Forested-Wetland Trends in the United States: An Economic Perspective.
W91-02486 2H

State Wetland Protection Legislation Affecting Forestry in the Northeastern United States.
W91-02487 6E

Cat Island Swamp: Window to a Fading Louisiana Ecology.
W91-02490 4C

Utility of Stream Habitat and Biota for Identifying Potential Conflicting Forest Land Uses: Montane Riparian Areas.
W91-02494 4C

Potential for Enhancing Riparian Habitats in the Southwestern United States with Watershed Practices.
W91-02495 4A

Use of Geomorphology in the Classification of Riparian Plant Associations in Mountainous Landscapes of Central Oregon, U.S.A.
W91-02496 2H

Streamside Management Units in the Pacific Northwest.
W91-02497 6B

Woody Plant Succession on Earthquake-Uplifted Coastal Wetlands of the Copper River Delta, Alaska.
W91-02498 2H

Growth and Development of Bald-Cypress/Water-Tupelo Stands under Continuous Versus Seasonal Flooding.
W91-02499 2E

Comparative Study of the Response of Taxodium distichum and Nyssa aquatica Seedlings to Soil Anaerobiosis and Salinity.
W91-02500 2E

Long-Term Trends in the Bald-Cypress (Taxodium distichum) Resource in Louisiana (U.S.A.)
W91-02501 2H

Inventory Technology: 'Ebb Tides', 'Flash Floods', and 'Whirlpools'.
W91-02502 7A

Acid Depositions, Summer Droughts, Forest Decline: Development of the Nitrous Acid Hypothesis.
W91-02828 5C

FOREST HYDROLOGY
Element Budgets of Two Contrasting Catchments in the Black Forest (Federal Republic of Germany).
W91-02740 5

Influence of Acid Atmospheric Inputs on Surface Water Chemistry and Mineral Fluxes in a Declining Spruce Stand Within a Small Catchment (Vosges Massif, France).
W91-02741 5

Precipitation, Throughfall, Soil Solution and Streamwater Chemistry in a Holm-Oak (Quercus ilex) Forest.
W91-02744 2

Hydrogeochemical Variations in Hafren Forest Stream Waters, Mid-Wales.
W91-02745 4

Preliminary Analysis of Water and Solute Movement Beneath a Coniferous Hillslope in Mid-Wales, U. K.
W91-02746 2

FOREST MANAGEMENT
Possibilities for Regeneration of Floodplain Forests within the Framework of the Flood-Protection Measures on the Upper Rhine, West Germany.
W91-02472 4

Identification and Inventory of Philippine Forested-Wetland Resource.
W91-02473

Mangrove Forest Resources in Indonesia.
W91-02474

Mangroves in Kampuchea.
W91-02475

Inventory and Monitoring of Forested-Wetland Resources of ASEAN.
W91-02476

Status and Distribution of Forested Wetlands in Tropical South America.
W91-02477

Approach to the Inventory of Forested Wetlands for Timber-Harvesting Impact Assessment.
W91-02485

Hydrogeochemical Variations in Hafren Forest Stream Waters, Mid-Wales.
W91-02745

Effect of Clearfelling a Sitka Spruce (Picea sitchensis) Plantation on Solute Concentrations in Drainage Water.
W91-02751 4C

FOREST SOILS
Estimating Erosion Risk on Forest Lands Using Improved Methods of Discriminant Analysis.
W91-02181 2J

FOREST WATERSHEDS
Hydrogeochemical Processes Controlling the Transport of Dissolved Organic Carbon Through a Forested Hillslope.
W91-02159 5B

Estimating Erosion Risk on Forest Lands Using Improved Methods of Discriminant Analysis.
W91-02181 2J

Status and Distribution of Forested Wetlands in Tropical South America.
W91-02477 2H

Status and Trends of U.S. Wetlands and Deepwater Habitats.
W91-02483 4C

Utility of Stream Habitat and Biota for Identifying Potential Conflicting Forest Land Uses: Montane Riparian Areas.
W91-02494 4C

Element Budgets of Two Contrasting Catchments in the Black Forest (Federal Republic of Germany).
W91-02740 5B

Influence of Acid Atmospheric Inputs on Surface Water Chemistry and Mineral Fluxes in a Declining Spruce Stand Within a Small Catchment (Vosges Massif, France).
W91-02741 5B

Hydrogeochemical Variations in Hafren Forest Stream Waters, Mid-Wales.
W91-02745 4C

Effect of Clearfelling a Sitka Spruce (Picea sitchensis) Plantation on Solute Concentrations in Drainage Water.
W91-02751 4C

ORESTRY
Identification and Inventory of Philippine Forested-Wetland Resource.
W91-02473 2H

Mangrove Forest Resources in Indonesia.
W91-02474 2H

Mangroves in Kampuchea.
W91-02475 2H

State Wetland Protection Legislation Affecting Forestry in the Northeastern United States.
W91-02487 6E

Federal Legislation and Wetlands Protection in Georgia: Legal Foundations, Classification Schemes, and Industry Implications.
W91-02488 6E

Streamside Management Units in the Pacific Northwest.

Long-Term Trends in the Bald-Cypress (Taxodium distichum) Resource in Louisiana (U.S.A).
W91-02501 2H

nventory Technology: 'Ebb Tides', 'Flash Floods', and 'Whirlpools'.
W91-02502 7A

RESTS
Present Situation of the European Floodplain Forests.
W91-02471 4C

Southwestern Riparian Plant Communities: Site Characteristics, Tree Species Distributions, and Size-class Structures.
W91-02491 2H

Possible Effects of Residential Development on Streamflow, Riparian Plant Communities, and Fisheries on Small Mountain Streams in Central Arizona.
W91-02493 4C

Utility of Stream Habitat and Biota for Identifying Potential Conflicting Forest Land Uses: Montane Riparian Areas.
W91-02494 4C

Streamside Management Units in the Pacific Northwest.
W91-02497 6B

FORMIC ACID
Sources and Sinks of Formic, Acetic, and Pyruvic Acids Over Central Amazonia. 2. Wet Season.
W91-02838 5B

FORT PILLOW AQUIFER
Altitude of Potentiometric Surface, Fall 1985, and Historic Water-Level Changes in the Fort Pillow Aquifer in Western Tennessee.
W91-02248 2F

FRACTALS
Fractal Approach to Spatial Variability of West African Rainfall Events (Approche Fractale de la Variabilite Spatiale des Episodes Pluvieux de l'Afrique de l'Ouest).
W91-02301 2B

FRACTURE PERMEABILITY
Adsorptive Solute Transport in Fractured Rock: Analytical Solutions for Delta-Type Source Conditions.
W91-02164 5B

Saturated Hydraulic Conductivity of Clayey Tills and the Role of Fractures.
W91-02168 2F

Some Anomalous Features of Flow and Solute Transport Arising from Fracture Aperture Variability.
W91-02867 2F

Gas Migration in Discrete Fracture Networks.
W91-02871 5E

FRANCE
Drought in France in 1989 (La Secheresse de 1989).
W91-02048 2B

Classification of the Principal French Reservoirs.
W91-02385 2H

Alluvial Aquifer of the Grand Gravier (Rhone Valley, France) Modelling and Protection.
W91-02721 5G

Influence of Acid Atmospheric Inputs on Surface Water Chemistry and Mineral Fluxes in a Declining Spruce Stand Within a Small Catchment (Vosges Massif, France).
W91-02741 5B

Effects of Vegetation Type on the Biogeochemistry of Small Catchments (Mont Lozere, France).
W91-02742 2K

Polychlorinated Biphenyls Partitioning in Waters from River, Filtration Plant and Wastewater Plant: The Case for Paris (France).
W91-02786 5B

Sulphur and Oxygen Isotopes of Dissolved Sulphur Species in Formation Waters from the Dogger Geothermal Aquifer, Paris Basin, France.
W91-02890 2K

FREEZING
Physics of Supercooling of Thin Water Skins Covering Gyrating Hailstones.
W91-02119 2C

Field Frost Heave Measurement and Prediction During Periods of Seasonal Frost.
W91-02150 2C

Freezing of Water and Wastewater Sludges.
W91-02571 5D

FREQUENCY ANALYSIS
Improved Methods for Regional Flood Frequency Analysis.
W91-02243 2E

FRESHWATER
Determination of Photochemically Produced Hydroxyl Radicals in Seawater and Freshwater.
W91-02852 5A

FROGS
Artificially Induced Metamorphosis Acetone in Acris gryllus.
W91-02201 5C

FROST HEAVING
Field Frost Heave Measurement and Prediction During Periods of Seasonal Frost.
W91-02150 2C

FROZEN SOILS
Compressive Strength Behavior of Fine-Grained Frozen Soils.
W91-02940 8D

FUCUS
Fucus vesiculosus as an Indicator of Heavy Metal Availability in a Fish Farm Recipient in the Northern Baltic Sea.
W91-02560 5A

FUEL
Digester Gas is Alternate Fuel.
W91-02764 5D

FUNGI
Key Factors in Taste and Odour Problems for Municipal Water Works Using Surface Water Sources.
W91-02394 5F

FURROW IRRIGATION
Irrigation Trials: Basis for the Design of Furrow Systems.
W91-02315 3F

GAGING STATIONS
Evaluation of Regional Flood Frequency Analysis with a Region of Influence Approach.
W91-02856 2E

GAMMA RADIATION
Gamma Emitters in Hong Kong Water.
W91-02816 5B

Decontamination Technologies for Release from Bioprocessing Facilities: Part V. Decontamination of Sludge.
W91-02936 5D

GAS CHROMATOGRAPHY
Enzyme-Linked Immunosorbent Assay Compared with Gas Chromatography/Mass Spectrometry for the Determination of Triazine Herbicides in Water.
W91-02192 5A

Pyrolysis-GC-MS for Investigating High-Molecular-Weight THM Precursors and Other Refractory Organics.
W91-02418 5F

GAS MIGRATION
Gas Migration in Discrete Fracture Networks.
W91-02871 5E

GASTROPODS
Effects of Calcium and pH on the Reproductive Success of Amnicola limosa (Gastropoda).
W91-02064 5C

Comparative Survey of Imposex in Northeast Pacific Neogastropods (Prosobranchia) Related to Tributyltin Contamination, and Choice of a Suitable Bioindicator.
W91-02894 5A

GENOTOXICITY
Rainbow Trout Liver Activation Systems with the Ames Mutagenicity Test.
W91-02217 5A

Structure of an Anhydride Related to a Mutagenic Component of Drinking Water, 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone.
W91-02551 5A

Monitoring and Assessment of Mercury Pollution in the Vicinity of a Chloralkali Plant: I. Distribution, Availability and Genotoxicity of Sediment Mercury in the Rushikulya Estuary, India.
W91-02932 5B

GEOCHEMISTRY
Universal Scaling of Hydraulic Conductivities and Dispersivities in Geologic Media.
W91-02183 2F

Geochemistry of Batch-Extract Waters Derived from Spoil Material Collected at the Cordero Coal Mine, Powder River Basin, Wyoming.
W91-02222 5B

Geochemistry of the Stratified-Drift Aquifer in Killbuck Creek Valley West of Wooster, Ohio.
W91-02286 2F

Groundwater Quality in Rural Areas in Western Africa.
W91-02336 2F

Corrosivity Problems in Rural Water Supply Projects in Sahelian Areas of West Africa.
W91-02337 2F

Solution of Disseminated Calcite in Quartz Veins of Birrimien Schists in Burkina Faso as a Key to a Possible Aquifer Model.
W91-02346 2F

Relationship of Reservoir Biogeochemical Processes to the Structural Integrity of the World's First Totally Roller Compacted Concrete Dam.
W91-02399 8F

Hydrogeochemical and Isotopical Investigations of Ground and Surfacewaters at the Southwest Edge of the Harzmountains during an Artificial Induced High Water (Hydrogeochemische und Isotopenchemische Untersuchungen an Grund und Oberflachenwassern am Sudwestrand des Harzes Wahrend eines Kunstlich Induzierten Hochwassers).

GEOHYDROLOGY
Glaciation and Saline-Freshwater Mixing as
Possible Cause of Cave Formation in the Easte
Midcontinent Region of the United States:
Conceptual Model.
W91-02153

Till Genesis and Hydrogeological Properties.
W91-02165

Universal Scaling of Hydraulic Conductivit
and Dispersivities in Geologic Media.
W91-02183

Flow to a Heated Borehole in Porous, Therm
lastic Rock: Analysis.
W91-02185

Comparison of Darcian Flow in Correspond
Flat and Folded Surfaces.
W91-02186

Response of the Water Level in a Well to Ea
Tides and Atmospheric Loading Under Unc
fined Conditions.
W91-02188

Geohydrology and Groundwater Geochemi
at a Sub-Arctic Landfill, Fairbanks, Alaska.
W91-02253

Northeast Glacial Aquifers.
W91-02280

Northeast Glacial Aquifers RASA Project-
Overview of Results through 1987.
W91-02281

Upland Runoff as a Major Source of Rech
to Stratified Drift in the Glaciated North
W91-02282

Estimation of Water Available for Recharg
Sand and Gravel Aquifers in the Glac
Northeastern United States.
W91-02283

Evaluation of the Continuous Seismic-Refle
Method for Determining the Thickness an
thology of Stratified Drift in the Glac
Northeast.
W91-02284

Continuous Seismic-Reflection Profiling of
cial Drift along the Susquehanna, Chemung

LIBRARY U. S. G. S. Urbana, Illinois

Chenango Rivers, South-Central New York and North-Central Pennsylvania.
W91-02285 7B

Geochemistry of the Stratified-Drift Aquifer in Killbuck Creek Valley West of Wooster, Ohio.
W91-02286 2F

Use of Oxygen-18 and Deuterium Mass-Balance Analysis to Evaluate Induced Recharge to Stratified-Drift Aquifers.
W91-02287 2F

State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa.
W91-02288 2A

Contribution of CIEH in the Field of Hydrogeology (Contribution du CIEH dans le Secteur de l'Hydrologie).
W91-02294 2A

Hydrogeological and Geophysical Electromagnetic Study of the Alluvial Aquifer of Wadi Teloua, Agadez, Niger (Etude Hydrogeologique et Geophysique Electromagnetique de la Nappe Alluviale du Kori Teloua, Agadez, Niger).
W91-02323 2F

Aquifer Characteristics in the Sedimentary Basins of the Semi-Arid and Arid Areas of Kenya.
W91-02329 2F

Study of Groundwater Resources of the Bubaque and Bolama Islands (Bissagos Islands) (Etude des Ressources en Eau Souterraine des Iles de Bubaque et Bolama (Archipel des Bijagos)).
W91-02331 2F

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 1. Estimation of Recharge.
W91-02332 2F

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 2. Regional Investigation of Geological Structures.
W91-02333 7B

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 3. Estimation of Resources.
W91-02334 2F

Groundwater Quality in Rural Areas in Western Africa.
W91-02336 2F

Hydrogeological Role of the Faults in the Valleys of the South of Air (Republic of Niger) (Sur les Roles Hydrogeologiques des Failles dans les Vallees du Sud d'Air (Republique du Niger)).
W91-02341 2F

Influence of Continental Rifting on the Hydrogeology of the Bahi Drainage Basin, Dodoma Province, Central Tanzania.
W91-02342 2F

Solution of Disseminated Calcite in Quartz Veins of Birrimien Schists in Burkina Faso as a Key to a Possible Aquifer Model.
W91-02346 2F

Post Graduate Course in Hydrology and Hydrogeology (Formation Post-Universitaire en Hydrologie et Hydrogeologie).
W91-02363 6E

Soil Water Relations on a Hilltop Cornfield in Central Appalachia.
W91-02592 2G

Evaluation of Hydrogeological Parameters in Heterogeneous Porous Media.
W91-02673 2F

Indicator Conditional Simulation of the Architecture of Hydraulic Conductivity Fields: Application to a Sand-Shale Sequence.
W91-02676 2F

Hydrogeology and Water Chemistry in the Weathered Crystalline Rocks of Southwestern Nigeria.
W91-02691 2F

Characterizing the Hydrogeological Variability of a Sand Aquifer in the Region of a Domestic Waste Disposal Site.
W91-02692 5B

GEOLOGIC FORMATIONS

Comparison of Darcian Flow in Corresponding Flat and Folded Surfaces.
W91-02186 2F

GEOLOGIC FRACTURES

Saturated Hydraulic Conductivity of Scandinavian Tills.
W91-02167 2F

Prospecting for Aquifer Fractures in the Crystalline Basement by Soil Radon Analysis (Prospection des Fractures Aquiferes du Socle Cristallin par Dosage du Gaz Radon Contenu dans le Sol).
W91-02324 2F

Improved Yield of Rural Water Works Through Hydraulic Fracturing Experiments (Amelioration de la Productivite des Ouvrages d'Hydraulique Villageoise par Fracturation Hydraulique Experimentation).
W91-02335 4B

Hydrogeological Role of the Faults in the Valleys of the South of Air (Republic of Niger) (Sur les Roles Hydrogeologiques des Failles dans les Vallees du Sud d'Air (Republique du Niger)).
W91-02341 2F

Some Anomalous Features of Flow and Solute Transport Arising from Fracture Aperture Variability.
W91-02867 2F

Gas Migration in Discrete Fracture Networks.
W91-02871 5E

Observations on the Development of Pore-Water Stresses During Piezocone Penetration in Clays.
W91-02938 7B

Contaminant Migration Through Fractured Till into an Underlying Aquifer.
W91-02941 5B

Migration of Pollutants in Groundwater: IV. Modeling of the Pumping of Contaminants from Fractured Bedrock.
W91-02945 2F

GEOLOGIC HISTORY

Halite Depositional Facies in a Solar Salt Pond: A Key to Interpreting Physical Energy and Water Depth in Ancient Deposits.
W91-02152 2J

GEOLOGY

Geology and Ground-Water Resources of the Cockfield Formation in Western Tennessee.
W91-02225 2F

Fan-Delta and Braid-Delta Systems in Pennsylvanian Sandia Formation, Taos Trough, Northern New Mexico: Depositional and Tectonic Implications.
W91-02519 2J

GEOMORPHOLOGY

Importance of Geographical Aspects in Environmental Studies of Hydro-Quebec Reservoirs.
W91-02396 2H

Southwestern Riparian Plant Communities: Site Characteristics, Tree Species Distributions, and Size-class Structures.
W91-02491 2H

Use of Geomorphology in the Classification of Riparian Plant Associations in Mountainous Landscapes of Central Oregon, U.S.A.
W91-02496 2H

Fan-Delta and Braid-Delta Systems in Pennsylvanian Sandia Formation, Taos Trough, Northern New Mexico: Depositional and Tectonic Implications.
W91-02519 2J

Watershed Delineation with Triangle-Based Terrain Models.
W91-02525 2E

Runoff Generation in a Sandy Area--The Nizzana Sands, Western Negev, Israel.
W91-02811 2A

Spatial Uniformity of Power and the Altitudinal Geometry of River Networks.
W91-02860 2E

Incorporating Hillslope Effects into the Geomorphologic Instantaneous Unit Hydrograph.
W91-02868 2E

GEOPHYSICAL EXPLORATION

Geophysical Prospecting for Ground Water Exploration in Discontinuous Aquifers for Rural Water Supply Projects in the Sahel.
W91-02325 2F

New Instruments for Electrical and Audiomagnetotelluric Prospecting (Caracteristiques des Equipements Modernes de Prospection Geophysique par Methods Electrique ou Audiomagnetotellurique).
W91-02326 7B

Geophysical Reconnaissance in a Fissured Structure: Example in Liptako, Rep. Niger (Reconnaissance Geophysique en Milieu Fissure: Exemple au Liptako, Rep. Niger).
W91-02327 2F

Geophysical Methodology Applied to Rural Water Supply in Bedrock Environment: Preliminary Results (Methodologie Geophysique Appliquee a l'Hydraulique Villageoise en Zone de Socle: Resultats Preliminaires).
W91-02328 2F

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 2. Regional Investigation of Geological Structures.
W91-02333 7B

GEOPHYSICAL STUDIES

Exploration of Karstified Joints in Precambrian Limestone Aquifers of the Gondo Plain (Mali) with Electromagnetic Horizontal-Loop Methods (Localisation des Fractures Karstifiees des Calcaires Precambbriens dans la Plaine du Gondo (Mali) par la Prospection Electromagnetique Bipole).
W91-02321 2F

Electric Method in Village Hydraulic Projects in Benin: The Case of Crystalline Formations (Granite-Sandstone) (La Methode Electrique en Hydraulique Villageoise: Cas des Formations Cristallines (Granite-Gneiss)).
W91-02322 2F

GEOPHYSICAL SURVEYS

Evaluation of the Continuous Seismic-Reflection Method for Determining the Thickness and Lithology of Stratified Drift in the Glaciated Northeast.
W91-02284 7B

LIBRARY U. S. Geological Survey

GEOPHYSICAL SURVEYS

Continuous Seismic-Reflection Profiling of Glacial Drift along the Susquehanna, Chemung, and Chenango Rivers, South-Central New York and North-Central Pennsylvania.
W91-02285 7B

Prospecting for Aquifer Fractures in the Crystalline Basement by Soil Radon Analysis (Prospection des Fractures Aquiferes du Socle Cristallin par Dosage du Gaz Radon Contenu dans le Sol).
W91-02324 2F

Geophysical Investigation--Southwestern Great Artesian Basin.
W91-02529 8E

Combining Surface Geoelectrics and Borehole Measurements for Contamination Control.
W91-02685 5A

Hydrogeology and Water Chemistry in the Weathered Crystalline Rocks of Southwestern Nigeria.
W91-02691 2F

GEORGIA

Modelling Streamwater Chemistry as a Mixture of Soilwater End-Members-An Application to the Panola Mountain Catchment, Georgia, U. S. A.
W91-02754 5B

GEOSTATISTICS

Approximation of Confidence Limits on Sample Semivariograms from Single Realizations of Spatially Correlated Random Fields.
W91-02187 7C

Estimation of the Transmissivity of the Santiago Aquifer, Chile, Using Different Geostatistical Methods.
W91-02679 2F

Combining Surface Geoelectrics and Borehole Measurements for Contamination Control.
W91-02685 5A

GEOTHERMAL STUDIES

Flow to a Heated Borehole in Porous, Thermoelastic Rock: Analysis.
W91-02185 2F

GEOTHERMAL WATER

Sulphur and Oxygen Isotopes of Dissolved Sulphur Species in Formation Waters from the Dogger Geothermal Aquifer, Paris Basin, France.
W91-02890 2K

Metal-Organic Associations in Sediments--II. Algal Mats in Contact with Geothermal Waters.
W91-02892 2J

GERMANY

Vertical Mixing in Uberlinger See, Western Part of Lake Constance.
W91-02450 2H

Present Situation of the European Floodplain Forests.
W91-02471 4C

Possibilities for Regeneration of Floodplain Forests within the Framework of the Flood-Protection Measures on the Upper Rhine, West Germany.
W91-02472 4A

Finite Element Groundwater Model as Essential Planning Tool: Microbiological Denitrification of a Well Field at Broichhof.
W91-02703 5F

Models for a Rational Utilization of High Quality Groundwater Resources.
W91-02715 3E

Finite Element Combined Surface Water/Groundwater Model for the River Rhine, Kehl/Strasbourg Reservoir.
W91-02716 5G

Element Budgets of Two Contrasting Catchments in the Black Forest (Federal Republic of Germany).
W91-02740 5B

Microbial Colonization of Aquifer Sediment Exposed in a Groundwater Well in Northern Germany.
W91-02767 2F

GHANA

Irrigation Trials: Basis for the Design of Furrow Systems.
W91-02315 3F

GIARDIA

Comparison of the Zinc Sulfate and Immunofluorescence Techniques for Detecting Giardia and Cryptosporidium.
W91-02419 5A

Modeling Inactivation of Giardia lamblia.
W91-02570 5F

GLACIAL AQUIFERS

Till Genesis and Hydrogeological Properties.
W91-02165 2F

Northeast Glacial Aquifers.
W91-02280 2F

Northeast Glacial Aquifers RASA Project--An Overview of Results through 1987.
W91-02281 2F

Upland Runoff as a Major Source of Recharge to Stratified Drift in the Glaciated Northeast.
W91-02282 2F

Estimation of Water Available for Recharge to Sand and Gravel Aquifers in the Glaciated Northeastern United States.
W91-02283 2F

Evaluation of the Continuous Seismic-Reflection Method for Determining the Thickness and Lithology of Stratified Drift in the Glaciated Northeast.
W91-02284 7B

Continuous Seismic-Reflection Profiling of Glacial Drift along the Susquehanna, Chemung, and Chenango Rivers, South-Central New York and North-Central Pennsylvania.
W91-02285 7B

Geochemistry of the Stratified-Drift Aquifer in Killbuck Creek Valley West of Wooster, Ohio.
W91-02286 2F

Use of Oxygen-18 and Deuterium Mass-Balance Analysis to Evaluate Induced Recharge to Stratified-Drift Aquifers.
W91-02287 2F

GLACIAL DRIFT

Reconstruction and Dynamics of the Late Wisconsin 'Ontario' Ice Dome in the Finger Lakes Region, New York.
W91-02151 2C

Upland Runoff as a Major Source of Recharge to Stratified Drift in the Glaciated Northeast.
W91-02282 2F

Continuous Seismic-Reflection Profiling of Glacial Drift along the Susquehanna, Chemung, and Chenango Rivers, South-Central New York and North-Central Pennsylvania.
W91-02285 7B

Use of Oxygen-18 and Deuterium Mass-Balan Analysis to Evaluate Induced Recharge Stratified-Drift Aquifers.
W91-02287

Contaminant Migration Through Fractured T into an Underlying Aquifer.
W91-02941

Impact of Synthetic Leachate on the Hydrau Conductivity of a Smectitic Till Underlying Landfill Near Saskatoon, Saskatchewan.
W91-02943

GLACIAL LAKES

Effects of Glacial Surging on Sedimentation i Modern Ice-Contact Lake, Alaska.
W91-02520

GLACIAL SEDIMENTS

Till Genesis and Hydrogeological Properties.
W91-02165

Methods for Measuring the Saturated Hydrau Conductivity of Tills.
W91-02166

Saturated Hydraulic Conductivity of Scandi vian Tills.
W91-02167

Saturated Hydraulic Conductivity of Clay Tills and the Role of Fractures.
W91-02168

Glaciomarine Sedimentation in Disraeli Fjic High Arctic Canada.
W91-02929

GLACIER BALANCE

Fast-Flowing Outlet Glaciers on Svalbard Caps.
W91-02154

GLACIER MASS BALANCE

Glacial Mass Balance Determination in the cumulation Zone by In situ Measurements Tchernobyl Radioactivity (Determination Bilan Glaciaire en Zone d'Accumulation Mesure In Situ de la Radioactivite due a Tc nobyl).
W91-02052

Reconstruction and Dynamics of the Late consin 'Ontario' Ice Dome in the Finger L Region, New York.
W91-02151

Fast-Flowing Outlet Glaciers on Svalbard Caps.
W91-02154

GLACIER SURGES

Effects of Glacial Surging on Sedimentation Modern Ice-Contact Lake, Alaska.
W91-02520

GLACIERS

Floods of 1987 in the Glacial Basins Situate Pennine Alps in Switzerland (Les Crues de 1987 dans les Bassins Versants Glaciaires Alps Pennines).
W91-02049

Remote Sensing Applied to Glacier Superv in the French Alps (years 1986, 1987 1988)(Teledetection Appliquee au suivi des ciers des Alpes Francaises (annees 1986, 19 1988)).
W91-02051

Reconstruction and Dynamics of the Late consin 'Ontario' Ice Dome in the Finger L Region, New York.
W91-02151

Fast-Flowing Outlet Glaciers on Svalbard Ice Caps.
W91-02154 2C

Effects of Glacial Surging on Sedimentation in a Modern Ice-Contact Lake, Alaska.
W91-02520 2J

GLACIOHYDROLOGY
Remote Sensing Applied to Glacier Supervision in the French Alps (years 1986, 1987 and 1988)(Teledetection Appliquee au suivi des Glaciers des Alpes Francaises (annees 1986, 1987 et 1988)).
W91-02051 7B

Glaciation and Saline-Freshwater Mixing as a Possible Cause of Cave Formation in the Eastern Midcontinent Region of the United States: A Conceptual Model.
W91-02153 2F

Fast-Flowing Outlet Glaciers on Svalbard Ice Caps.
W91-02154 2C

Effects of Glacial Surging on Sedimentation in a Modern Ice-Contact Lake, Alaska.
W91-02520 2J

Glaciomarine Sedimentation in Disraeli Fjiord, High Arctic Canada.
W91-02929 2J

LACIOLOGY
Reconstruction and Dynamics of the Late Wisconsin 'Ontario' Ice Dome in the Finger Lakes Region, New York.
W91-02151 2C

Glaciomarine Sedimentation in Disraeli Fjiord, High Arctic Canada.
W91-02929 2J

OBAL WARMING
New Method to Determine Regional Evapotranspiration.
W91-02184 2D

Flooding and Saltwater Intrusion: Potential Effects on Survival and Productivity of Wetland Forests Along the U.S. Gulf Coast.
W91-02489 4C

AT LAKE
Hydrology of Goat Lake Watershed, Snohomish County, Washington, 1982-87.
W91-02227 5B

VERNMENTAL INTERRELATIONS
Missouri River Management Project: Learning Cooperate.
W91-02264 6A

ate Goals in Indian Water Rights Disputes.
W91-02269 6E

APHICAL ANALYSIS
teractive Groundwater Modelling: Colour raphics, ICAD and AI.
W91-02699 2F

SSES
getation Change on the Ouse Washes Wetd, England, 1972-1988 and Effects on Their nservation Importance.
W91-02515 2H

SSLANDS
getation Change on the Ouse Washes Wetd, England, 1972-1988 and Effects on Their nservation Importance.
W91-02515 2H

VEL MINING
avel Extraction and Water Resources Manment of the Denge Gravel Aquifer, Kent, gland.
W91-02723 4C

GRAVEL RIVERS
Width and Depth of Self-Formed Straight Gravel Rivers with Bank Vegetation.
W91-02865 2E

GRAVITY FLOW
New Madrid Pumping Station Gravity Flow Conduit and Confluence, New Madrid Floodway, Missouri: Hydraulic Model Investigation.
W91-02605 8B

Bed Configurations in Steady Unidirectional Water Flows: Part III. Effects of Temperature and Gravity.
W91-02927 2E

GRAVITY STUDIES
Fluid Behavior/Waste Management in Low-Gravity Environments.
W91-02565 5D

GREAT BRITAIN
Hydrological Aspects of the Development and Rapid Decay of the 1989 Drought.
W91-02428 2B

GREAT LAKES
Occurrence, Relative Abundance, and Size of Landlocked Sea Lamprey (Petromyzon marinus) Ammocoetes in Relation to Stream Characteristics in the Great Lakes.
W91-02068 2H

Toxicity of Chlorinated Bornane (Toxaphene) Residues Isolated from Great Lakes Lake Trout (Salvelinus namaycush).
W91-02435 5C

Nourishment of Perched Sand Dunes and the Issue of Erosion Control in the Great Lakes.
W91-02821 2J

GREECE
Coastal Water Pollution: Dissolved Heavy Metals and Suspended Particulate Matter.
W91-02057 5A

GREEN BAY
Microcontaminants and Reproductive Impairment of the Forster's Tern on Green Bay, Lake Michigan-1983.
W91-02441 5C

GREENHOUSE EFFECT
New Method to Determine Regional Evapotranspiration.
W91-02184 2D

Elevated Atmospheric CO2 Effects on Belowground Processes in C3 and C4 Estuarine Marsh Communities.
W91-02406 5C

Biosphere and Climate.
W91-02803 2A

GROUNDWATER
Persistence of Aldicarb Residues in the Sandstone Aquifer of Prince Edward Island, Canada.
W91-02160 5B

Altitude of Potentiometric Surface, Fall 1985, and Historic Water-Level Changes in the Memphis Aquifer in Western Tennessee.
W91-02224 2F

Bibliography of U.S. Geological Survey Reports on the Water Resources of Florida, 1886-1989.
W91-02237 10C

Water-Quality, Well Construction, and Groundwater Level Data for an Investigation of Radionuclides in Ground Water, Hickman and Maury Counties, Tennessee.
W91-02238 2F

Water Resources Data for Florida, Water Year 1989, Volume 3B: Southwest Florida Ground Water.
W91-02240 7C

Water Resources Data for Utah, Water Year 1989.
W91-02241 7C

Agricultural Pesticides and Groundwater in North Carolina: Identification of the Most Vulnerable Areas.
W91-02245 5G

Altitude of Potentiometric Surface, Fall 1985, and Historic Water-Level Changes in the Fort Pillow Aquifer in Western Tennessee.
W91-02248 2F

Hydrogeologic Reconnaissance of the Swope Oil Superfund Site and Vicinity, Camden and Burlington Counties, New Jersey.
W91-02249 2F

Water Resources Data for Arkansas, Water Year 1989.
W91-02261 7C

Water Resources for Florida, Water Year 1989, Volume 2A. South Florida - Surface Water.
W91-02625 7C

Water Resources Data for Florida, Water Year 1989, Volume 2B. South Florida - Ground Water.
W91-02626 7C

Water Resources Data for Florida, Water Year 1989, Volume 3A: Southwest Florida Surface Water.
W91-02627 7C

Water Resources for California, Water Year 1989, Volume 4: Northern Central Valley Basins and the Great Basin from Honey Lake Basin to Oregon State Line.
W91-02628 7C

Water Resources Data for Massachusetts and Rhode Island, Water Year 1988.
W91-02629 7C

Water Resources Data for Missouri, Water Year 1989.
W91-02630 7C

Water Resources Data for Montana, Water Year 1989.
W91-02631 7C

Water Resources Data for New Jersey, Water Year 1989, Volume 1: Atlantic Slope Basins, Hudson River to Cape May.
W91-02632 7C

Water Resources Data for New Jersey, Water Year 1989, Volume 2: Delaware River Basin and Tributaries to Delaware Bay.
W91-02633 7C

Water Resources Data for New York, Water Year 1989, Volume 2: Long Island.
W91-02634 7C

Water Resources Data for Pennsylvania, Water Year 1989. Volume 2: Susquehanna and Potomac River Basins.
W91-02635 7C

Water Resources Data for Puerto Rico and the U.S. Virgin Islands, Water Year 1989.
W91-02636 7C

Water Resources Data for South Carolina, Water Year 1989.

HAZARDOUS WASTES
Assessing Detoxification of a Complex Hazardous Waste, Using the Microtox Bioassay.
W91-02204 5E

Hazardous Waste Minimization: Source Reduction Alternatives in the Aerospace Industry.
W91-02411 5D

Health Effects of Chemical Waste in an Urban Community.
W91-02952 5C

HEAD LOSS
Head Losses in Storm Sewer Manholes: Submerged Jet Theory.
W91-02916 8B

HEADWATERS
Soil Water in the Riparian Zone as a Source of Carbon for a Headwater Stream.
W91-02747 2H

HEAT BUDGET
Tropical Squall Line Observed During the COPT 81 Experiment in West Africa. Part III: Heat and Moisture Budgets.
W91-02761 2B

HEAT STORAGE
Diel and Seasonal Energy Transfer, Storage and Stratification in African Reservoirs and Lakes.
W91-02370 2H

Aquifer Thermal Energy Storage: A Numerical Simulation of Field Experiments in China.
W91-02866 4B

HEAT TRANSFER
Coupled Water and Heat Transport in Ridged Soils.
W91-02133 2G

Estimates of Evapotranspiration with a One- and Two-Layer Model of Heat Transfer over Partial Canopy Cover.
W91-02408 2D

HEAVY METALS
Evaluation of the Sea Urchin Echinometra Iucunter as an Indicator of Heavy-Metal Contamination in Cuba (Evaluacion del Erizo de Mar Echinometra Iucunter como Indicator de Contaminacion por Metales Pesados, Cuba).
W91-02044 5A

Effects of Heavy Metals on Eels, Anguilla sp.
W91-02046 5C

Total Heavy Metal Concentrations Contained in the Sediment's Surface of Algiers Bay.
W91-02053 5B

Coastal Water Pollution: Dissolved Heavy Metals and Suspended Particulate Matter.
W91-02057 5A

Lead, Zinc, Cadmium, and Fluoride in Small Mammals from Contaminated Grassland Established on Fluorospar Tailings.
W91-02082 5B

Trace Metal Analysis of Sewage Sludge and Soils in Bahrain.
W91-02088 5E

Environmental Chemistry and Biological Effects of Cadmium Compounds.
W91-02173 5B

Effects of Environmental Parameters on the Elimination of Cadmium by Eastern Oysters, Crassostrea virginica.
W91-02198 5B

Heavy Metal Distribution in Anaerobic Sludges.
W91-02221 5D

Twenty Years of Land Application Research.
W91-02470 5E

Analytical Properties of 4,4'-Biazobenzenediazoaminobenzene and Its Applications in Spectrophotometry.
W91-02548 5A

Nutrients, Heavy Metals and Organic Micropollutants in an Eutrophic Brazilian Lagoon.
W91-02555 5B

Trace Metals in the Severn Estuary: A Reappraisal.
W91-02557 5B

Fucus vesiculosus as an Indicator of Heavy Metal Availability in a Fish Farm Recipient in the Northern Baltic Sea.
W91-02560 5A

Quantitative Assessment of the Sources and General Dynamics of Trace Metals in a Soft-Water Lake.
W91-02587 5B

Sewage Sludge: Application to Soils (Jan 85 - Jul 89). Citations from the BioBusiness Database.
W91-02643 5E

Heavy Metals in Drinking Water: Standards, Sources, and Effects (Jan 78 - Sep 89). Citations from the Life Sciences Collection Database.
W91-02647 5F

Cost Supplement to Technologies and Costs for the Removal of Mercury from Potable Water Supplies.
W91-02725 5F

Remobilization of Toxic Heavy Metals Adsorbed to Bacterial Wall-Clay Composites.
W91-02771 5B

Acute Toxicity of Heavy Metals to Aerobic Digestion of Waste Cheese Whey.
W91-02776 5D

Integrated Chemical and Biological Study of the Bioavailability of Metals in Sediments from Two Contaminated Harbours in New Brunswick, Canada.
W91-02931 5B

HEPTACHLOR
Tigris-Euphrates Delta: A Major Source of Pesticides to the Shatt al-Arab River (Iraq).
W91-02463 5B

HERBICIDES
Influence of the Herbicide Paraquat 'Gramaxon' on Growth and Metabolic Activity of Three Chlorophytes.
W91-02085 4A

Sublethal Effects of 2,2-Dichloropropionic Acid (Dalapon) on Fossaria cubensis, Intermediate Host of the Liver Fluke, Fasciola hepatica.
W91-02095 5C

Enzyme-Linked Immunosorbent Assay Compared with Gas Chromatography/Mass Spectrometry for the Determination of Triazine Herbicides in Water.
W91-02192 5A

Effects of Atrazine on Freshwater Microbial Communities.
W91-02202 5C

Source, Extent, and Degradation of Herbicides in a Shallow Aquifer Near Hesston, Kansas.
W91-02252 5B

Drinking Water Criteria Document for 2(2,4,5-Trichlorophenoxy) Propionic Acid (2,4,5-TP).
W91-02732 5G

HERRING
Mercury Accumulation in Relation to Size and Age of Atlantic Herring (Clupea harengus harengus) from the Southwestern Bay of Fundy, Canada.
W91-02433 5B

HETEROGENEITY
Experimental Investigation of Variable Density Flow and Mixing in Homogeneous and Heterogeneous Media.
W91-02862 2F

Analytical Solution for One-Dimensional Transport in Heterogeneous Porous Media.
W91-02863 5F

Stochastic Analysis of the Concentration Variability in a Three-Dimensional Heterogeneous Aquifer.
W91-02884 2F

Physical Habitat Template of Lotic Systems: Recovery in the Context of Historical Pattern of Spatiotemporal Heterogeneity.
W91-02902 2H

HIGH PERFORMANCE LIQUID CHROMATOGRAPHY
Liquid Chromatography-Mass Spectrometry: An Emerging Technology for Nonvolatile Compounds.
W91-02417 5A

HIGHWAY RELOCATION
Analysis of Water Surface and Flow Distribution for the Design Flood at a Proposed Highway Crossing of the Sabine River Near Tatum, Texas.
W91-02226 2E

HIGHWAYS
Investigation of Rest Area Requirements: Appendix-Pertinent Rest Area Literature.
W91-02620 5D

HISTOLOGY
Histopathology of Rainbow Trout Exposed to a Bleached Kraft Pulp Mill Effluent.
W91-02459 5C

HISTORY
Maya Utilization of Karst Groundwater Resources.
W91-02813 6D

HOMOGENEITY
Experimental Investigation of Variable Density Flow and Mixing in Homogeneous and Heterogeneous Media.
W91-02862 2F

HONG KONG
Gamma Emitters in Hong Kong Water.
W91-02816 5B

HORMONES
Premature Thelarche in Puerto Rico: A Search for Environmental Estrogenic Contamination.
W91-02429 5C

HUDSON RIVER
Long-Term Monitoring of Polychlorinated Biphenyls in the Hudson River (New York) Using Caddisfly Larvae and Other Macroinvertebrates.
W91-02464 5B

HUMAN DISEASES
Vulnerability of the Brazzaville Aquifer and the Risk of Contamination with Domestic Wastes (Problemes de Vulnerabilite de la Nappe de Brazzaville et Risques de Contamination par les Rejets Domestiques).
W91-02339 5B

Teletransmission of Hydrological Data Within the Framework of the Programme to Combat

LIBRARY U. S. Geological Survey

HUMAN DISEASES

Onchocerciasis (Teletransmission des Donnees Hydrologiques dans le Cadre du Programme de Lutte Contre l'Onchocercose).
W91-02353 7B

Impacts of Urban Waste on Surface Water in Ouagadougou and Bobo-Dioulasso (Burkina Faso) (Impacts des Rejets Urbains sur les Eaux de Surface a Ouagadougou et Bob-Dioulasso (Burkina Faso)).
W91-02369 5B

Environmental Epidemiology of Non-Hodgkin's Lymphoma in Eastern Nebraska.
W91-02507 5C

Assessment of Ocean Waste Disposal. Task 5. Human Health Impacts of Waste Constituents. II. Pathogens and Antibiotic-and Heavy Metal-Resistant Bacteria.
W91-02616 5E

HUMAN PATHOGENS

Comparison of the Zinc Sulfate and Immunofluorescence Techniques for Detecting Giardia and Cryptosporidium.
W91-02419 5A

HUMAN PHYSIOLOGY

Premature Thelarche in Puerto Rico: A Search for Environmental Estrogenic Contamination.
W91-02429 5C

HUMIC ACIDS

Effects of Environmental Parameters on the Elimination of Cadmium by Eastern Oysters, Crassostrea virginica.
W91-02198 5B

HUMIC SUBSTANCES

Pyrolysis-GC-MS for Investigating High-Molecular-Weight THM Precursors and Other Refractory Organics.
W91-02418 5F

HUNGARY

Groundwater Flow and Quality Studies in Szigetkoz Region, Northwest Hungary.
W91-02724 6G

HYDRAULIC CONDUCTIVITY

Macroporosity and Its Relation to Saturated Hydraulic Conductivity under Different Tillage Practices.
W91-02138 2G

Soil Water Diffusivity Determination by a Modified One-Step Outflow Method.
W91-02140 2G

Methods for Measuring the Saturated Hydraulic Conductivity of Tills.
W91-02166 7B

Saturated Hydraulic Conductivity of Scandinavian Tills.
W91-02167 2F

Saturated Hydraulic Conductivity of Clayey Tills and the Role of Fractures.
W91-02168 2F

Unsaturated Hydraulic Conductivity Determined by the Hot Air Method for Some Danish Till Soils.
W91-02169 2G

Universal Scaling of Hydraulic Conductivities and Dispersivities in Geologic Media.
W91-02183 2F

Optimal Groundwater Quality Management under Uncertainty: Incorporating the Effects of Spatial Variability of Hydraulic Conductivity.
W91-02708 5G

Modeling Infiltration into a Sealing Soil.
W91-02878 2G

Impact of Synthetic Leachate on the Hydraulic Conductivity of a Smectitic Till Underlying a Landfill Near Saskatoon, Saskatchewan.
W91-02943 5E

HYDRAULIC ENGINEERING

Hydrologic Design and Development of Hydraulic Structures.
W91-02312 8A

Environmental River Engineering.
W91-02845 4A

Turbine-Intake Fish-Diversion System.
W91-02915 8I

Head Losses in Storm Sewer Manholes: Submerged Jet Theory.
W91-02916 8B

Explicit Calculation of Pipe-Network Parameters.
W91-02917 8B

Modeling Channel Bed Transients Using Explicit F-D Schemes.
W91-02918 2E

First Step Away from Lacey's Regime Equations.
W91-02924 8B

HYDRAULIC EQUIPMENT

Upgrading Procurement Specifications for Hydroelectric Machines.
W91-02158 8C

HYDRAULIC FRACTURING

Improved Yield of Rural Water Works Through Hydraulic Fracturing Experiments (Amelioration de la Productivite des Ouvrages d'Hydraulique Villageoise par Fracturation Hydraulique Experimentation).
W91-02335 4B

Hydraulic Fracture in Earth and Rock-Fill Dams.
W91-02942 8A

HYDRAULIC MACHINERY

Soviet Design of Large Turbines for Wide Head Ranges.
W91-02155 8C

New Approach to Turbine Speed.
W91-02156 8C

Behaviour of Francis Units Under Partial Loads.
W91-02157 8C

Upgrading Procurement Specifications for Hydroelectric Machines.
W91-02158 8C

HYDRAULIC MINING

Laboratory Investigation of Beach Profiles in Tailings Disposal.
W91-02919 5E

HYDRAULIC MODELS

New Madrid Pumping Station Gravity Flow Conduit and Confluence, New Madrid Floodway, Missouri: Hydraulic Model Investigation.
W91-02605 8B

Yazoo Backwater Pumping Station Sump, West-Central Mississippi: Hydraulic Model Investigation.
W91-02606 8B

Bed Configurations in Steady Unidirectional Water Flows: Part I. Scale Model Study Using Fine Sands.
W91-02925 2E

Bed Configurations in Steady Unidirectional Water Flows: Part II. Synthesis of Flume Data.
W91-02926 2E

Bed Configurations in Steady Unidirection Water Flows: Part III. Effects of Temperatu and Gravity.
W91-02927 2

Flume Experiments on the Transport of Hea Minerals in Gravel-Bed Streams.
W91-02928

HYDRAULIC PROFILES

Split of Two-Phase Flow at a Horizontal Annular and Stratified Flow.
W91-02613

HYDRAULIC PROPERTIES

Hydraulic Properties of Four Soils in Niger a Implications for Water Balance Studies.
W91-02330

Energy Relations in Transient Closed-Cond Flow.
W91-02522

Superfund Record of Decision: M.W. Manufacturing, PA. First Remedial Action.
W91-02663 5G

Superfund Record of Decision: South Valley/ SJ-6, NM. Third Remedial Action.
W91-02664 5G

Impact of Distillery Effluent Application to Land on Soil Microflora.
W91-02946 5C

INDUSTRIAL WASTEWATER

North Carolina Plant Solves Textile-Wastewater Problems.
W91-02562 5D

Continuous Anaerobic Treatment of Pulping Wastewaters.
W91-02580 5D

Wastewater Treatment: Chemical Industry (Jan 70 - Sep 89). Citations from the Pollution Abstracts Database.
W91-02644 5D

Role of Resin Acids in the Anaerobic Toxicity of Chemithermomechanical Pulp Wastewater.
W91-02797 5D

Monitoring and Assessment of Mercury Pollution in the Vicinity of a Chloralkali Plant: I. Distribution, Availability and Genotoxicity of Sediment Mercury in the Rushikulya Estuary, India.
W91-02932 5B

INDUSTRIAL WATER

Models for a Rational Utilization of High Quality Groundwater Resources.
W91-02715 3E

INFILTRATION

Surface Features: One of the Key Elements of Sahelian Hydrology (Les Etats de Surface: Une des Clefs de l'Hydrologie Sahelienne).
W91-02297 2A

Hydraulic Properties of Four Soils in Niger and Implications for Water Balance Studies.
W91-02330 2G

Hydrological Response of Soil Surfaces to Rainfall as Affected by Cover and Position of Rock Fragments in the Top Layer.
W91-02812 2J

Modeling Infiltration into a Sealing Soil.
W91-02878 2G

INFILTRATION RATE

Water-Drop Kinetic Energy Effect on Infiltration in Sodium-Calcium-Magnesium Soils.
W91-02135 2G

Water Droplet Energy and Soil Amendments: Effect on Infiltration and Erosion.
W91-02136 2G

Polymer Effects on Erosion under Laboratory Rainfall Simulator Conditions.
W91-02137 2J

INFORMATION EXCHANGE

Analysis by Functions Applied to Hydrometry (L'analyse par Fonctions Application a 'Hydrometrie).
W91-02050 7C

INFORMATION SYSTEMS

CIEH's Contribution to the Development of Hydrology in Arid and Semi-Arid Areas in Africa (Contribution du CIEH au Developpement de l'Hydrologie dans les Zones Arides et Semi-arides d'Afrique).
W91-02292 2A

INFRARED RADIATION

Simplified Method to Estimate Regional 24-h Evapotranspiration from Thermal Infrared Data.
W91-02129 2D

INJECTION-PRODUCTION WELLS

Aquifer Thermal Energy Storage: A Numerical Simulation of Field Experiments in China.
W91-02866 4B

INJECTION WELLS

Hydrologic Hydrochemical Characterization of Texas Frio Formation Used for Deep-Well Injection of Chemical Wastes.
W91-02814 5B

INORGANIC COMPOUNDS

Information Collection Request for: National Primary Drinking Water Regulations for Inorganic Chemicals.
W91-02602 7B

INSECTICIDES

Response and Recovery of Brain Acetylcholinesterase Activity in Atlantic Salmon (Salmo salar) Exposed to Fenitrothion.
W91-02061 5A

Methylparathion-Induced Alterations in the Acetylcholinesterase and Phosphatases in a Penaeid Prawn, Metapenaeus monoceros.
W91-02097 5C

Residues of DDT and HCH in Major Sources of Drinking Water in Bhopal, India.
W91-02099 5B

Residues of Organochlorine Insecticides in Fish from Mahala Water Reservoir, Jaipur, India.
W91-02100 5B

Toxicity of Chlorinated Bornane (Toxaphene) Residues Isolated from Great Lakes Lake Trout (Salvelinus namaycush).
W91-02435 5C

Photocatalytic Degradation of Organophosphorous Insecticides in Aqueous Semiconductor Suspensions.
W91-02799 5D

INSTITUTIONAL CONSTRAINTS

Institutional Economics and Indian Water Projects-Does the Framework Make a Difference.
W91-02268 6A

INSTRUMENTATION

Field Frost Heave Measurement and Prediction During Periods of Seasonal Frost.
W91-02150 2C

PC-Based Analytical Stereoplotter for Wetland Inventories: An Efficient and Economical Photogrammetric Instrument for Field Offices.
W91-02503 7I

Estimation of the Contribution of the Sulfate Ion to Rainwater Acidity.
W91-02827 5I

Calibration of Time Domain Reflectometry for Water Content Measurement Using a Composite Dielectric Approach.
W91-02857 2C

Observations on the Development of Pore Water Stresses During Piezocone Penetration in Clays.
W91-02938 7

INTER-AFRICAN COMMITTEE FOR HYDRAULIC STUDIES

CIEH's Contribution to the Development of Hydrology in Arid and Semi-Arid Areas in Africa (Contribution du CIEH au Developpment de l'Hydrologie dans les Zones Arides et Semi-arides d'Afrique).
W91-02292 2

Contribution of CIEH in the Field of Hydrogeology (Contribution du CIEH dans le Secteur de l'Hydrologie).
W91-02294 2

INTERFLUX DAMS

Interflux Dams: Their Advantage for Saharan and Sahelian Africa (Les Barrages d'Inferoflux Leur Interet pour l'Afrique Saharienne et Sahelienne).
W91-02313 8

INTERSTATE COMMISSIONS

Toxic-Substance Control for the Ohio River.
W91-02564 2

INTERSTITIAL WATER

Pore Pressure Field Built Up in a Rapidly Eroded Soil Mass.
W91-02149

Observations on the Development of Pore Water Stresses During Piezocone Penetration in Clays.
W91-02938

INVERTEBRATES

Field Study of the Effects of Water Temperature, Discharge and Trout Odour on the Drift of Stream Invertebrates.
W91-02454

ION TRANSPORT

Effects of Vegetation Type on the Biogeochemistry of Small Catchments (Mont Lozere, France).
W91-02742

Longitudinal Patterns of Concentration-Discharge Relationships in Stream Water Drainage, the Hubbard Brook Experimental Forest, New Hampshire.
W91-02743

Precipitation, Throughfall, Soil Solution and Streamwater Chemistry in a Holm-Oak (Quercus ilex) Forest.
W91-02744 2K

Preliminary Analysis of Water and Solute Movement Beneath a Coniferous Hillslope in Mid-Wales, U. K.
W91-02746 2E

Short-Term Ionic Responses as Indicators of Hydrochemical Processes in the Allt A'Mharcaidh Catchment, Western Cairngorms, Scotland.
W91-02750 5B

IONIC STRENGTH
Ionic Strength in Deep Bed Filtration.
W91-02801 5D

IONS
Water-Drop Kinetic Energy Effect on Infiltration in Sodium-Calcium-Magnesium Soils.
W91-02135 2G

Ionic Strength in Deep Bed Filtration.
W91-02801 5D

IOWA
Superfund Record of Decision: Todtz, Lawrence Farm, IA. First Remedial Action--Final.
W91-02649 5G

IRON
Effects of Iron Cycling on Pb-210 Dating of Sediments in an Adirondack Lake, USA.
W91-02071 2J

Seasonal Changes in Iron Transport and Nature of Dissolved Organic Matter in a Humic River in Northern Finland.
W91-02810 2K

IRRIGATION DESIGN
Irrigation Trials: Basis for the Design of Furrow Systems.
W91-02315 3F

Groundwater Management by a Dual-Pipe Subirrigation System.
W91-02677 4B

IRRIGATION EFFECTS
Artificial Recharge in the Angas-Bremer Irrigation Area.
W91-02530 4B

Management of Groundwater-induced River Salinity due to Land Clearing in the Murray Basin, Southeastern Australia.
W91-02681 5G

Groundwater Management Strategy for Salinity Mitigation in the Victorian Riverine Plain, Australia.
W91-02713 3C

Artificial Recharge Pilot Projects in Gujarat, India.
W91-02717 4B

Application of Groundwater Modelling in Water Resources Management in Denmark.
W91-02719 5B

Wetlands and Groundwater: New Constraints in Groundwater Management.
W91-02722 6G

IRRIGATION PRACTICES
Impact of Water Control on Navajo Irrigation Projects.
W91-02278 3F

IRRIGATION WATER
Application of a Digital Geographic Data Base to Irrigation Water Rights Management.
W91-02598 6E

Access of Small and Marginal Farmers to Groundwater--A Field Study.
W91-02675 4B

Groundwater Management Strategy for Salinity Mitigation in the Victorian Riverine Plain, Australia.
W91-02713 3C

ISLANDS
Study of Groundwater Resources of the Bubaque and Bolama Islands (Bissagos Islands) (Etude des Ressources en Eau Souterraine des Iles de Bubaque et Bolama (Archipel des Bijagos)).
W91-02331 2F

ISOTOPE STUDIES
Stable Isotope Tracers of Nitrogen Sources to the Neuse River, North Carolina.
W91-02244 5C

Estimating Groundwater Exchange with Lakes: 1. The Stable Isotope Mass Balance Method.
W91-02873 2F

Estimating Groundwater Exchange with Lakes: 2. Calibration of a Three-Dimensional, Solute Transport Model to a Stable Isotope Plume.
W91-02874 2F

Sulphur and Oxygen Isotopes of Dissolved Sulphur Species in Formation Waters from the Dogger Geothermal Aquifer, Paris Basin, France.
W91-02890 2K

ISOTOPIC TRACERS
Prospecting for Aquifer Fractures in the Crystalline Basement by Soil Radon Analysis (Prospection des Fractures Aquiferes du Socle Cristallin par Dosage du Gaz Radon Contenu dans le Sol).
W91-02324 2F

Study of Piezometric Depressions by Environmental Isotopes: First Data on Examples in Mali (Etude des Depressions Piezometriques par les Isotopes de l'Environnement: Premieres Donnees sur des Exemples au Mali).
W91-02343 2F

Origin and Evolution of Formation Waters, Alberta Basin, Western Canada Sedimentary Basin. II. Isotope Systematics and Water Mixing.
W91-02889 2K

ISRAEL
Role of Groundwater in Israel's Integrated Water System.
W91-02714 4B

Runoff Generation in a Sandy Area--The Nizzana Sands, Western Negev, Israel.
W91-02811 2A

ITALY
Microbial Quality of the Water in the Distribution System of Florence.
W91-02144 5F

Influence of Waste Waters from the City of Venice and the Hinterland on the Eutrophication of the Lagoon.
W91-02930 5C

Study on the Hydrology and Phytoplankton of the Varano Lake (Adriatic Sea) During an Annual Cycle (May 1985-April 1986). (Etude sur Lac de Varano (Mer Adriatique): Mai 1985-Avril 1986).
W91-02934 2L

IVORY COAST
Use of a Distributed Model of a Small Savannah Catchment (Booro-Borotou, Ivory Coast) Utilisation d'un Modele Distribue sur un Petit Bassin Versant de Savane (Booro-Borotou, Cote d'Ivoire).
W91-02310 2A

JORDAN
Feasibility Study on the Groundwater Development for the Water Supply of an Oil Shale Processing Plant in Central Jordan.
W91-02720 4B

JUVENILE GROWTH STAGE
Epidermal Response to pH, Aluminum, and Calcium Exposure in Brook Trout (Salvelinus fontinalis) Fry.
W91-02106 5C

Responses of Brook Trout (Salvelinus fontinalis) Fry to Fluctuating Acid, Aluminum, and Low Calcium Exposure.
W91-02107 5C

KALAHARI DESERT
Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 1. Estimation of Recharge.
W91-02332 2F

KAMPUCHEA
Mangroves in Kampuchea.
W91-02475 2H

KANSAS
Water-Resources Activities of the U.S. Geological Survey in Kansas--Fiscal Years 1987 and 1988.
W91-02236 7C

Source, Extent, and Degradation of Herbicides in a Shallow Aquifer Near Hesston, Kansas.
W91-02252 5B

Patterns and Controls of Nitrogen in Tallgrass Prairie Streams.
W91-02405 2H

KARST HYDROLOGY
Glaciation and Saline-Freshwater Mixing as a Possible Cause of Cave Formation in the Eastern Midcontinent Region of the United States: A Conceptual Model.
W91-02153 2F

Influence of Precipitation on the Quality of Karst Groundwater in Industrial Zones.
W91-02686 5B

Maya Utilization of Karst Groundwater Resources.
W91-02813 6D

Hydrogeological Approach to Investigation in Karst for Possible Modification of Groundwater Regime and Increase of Recoverable Reserves.
W91-02820 4B

KENTUCKY RIVER
Summary of Biological Investigations Relating to Surface-Water Quality in the Kentucky River Basin, Kentucky.
W91-02232 5C

KENYA
Aquifer Characteristics in the Sedimentary Basins of the Semi-Arid and Arid Areas of Kenya.
W91-02329 2F

KESTERSON RESERVOIR
Organic Selenium Distribution in Selected California Soils.
W91-02134 5B

Selenium Teratogenesis in Natural Populations of Aquatic Birds in Central California.
W91-02206 5C

Toxicity of Inorganic and Organic Selenium to Daphnia magna (Cladocera) and Chironomus riparus (Diptera).
W91-02216 5C

KILLBUCK CREEK VALLEY
Geochemistry of the Stratified-Drift Aquifer in Killbuck Creek Valley West of Wooster, Ohio.
W91-02286 2F

KILLIFISH
Effects of Wastewater Treatment and Seawater Dilution in Reducing Lethal Toxicity of Municipal Wastewater to Sheepshead Minnow (Cyprinodon variegatus) and Pink Shrimp (Penaeus duorarum).
W91-02535 5D

KINETICS
Transformation Kinetics of Trace-Level Halogenated Organic Contaminants in a Biologically Active Zone (BAZ) Induced by Nitrate Injection.
W91-02162 5G

Kinetic Study on Methanogenesis by Attached Biomass in a Fluidized Bed.
W91-02792 5D

KJELDAHL PROCEDURE
Periphyton Ash Weight Estimation from Residue Not Digested after Hach Method of Kjeldahl Protein Nitrogen Analysis.
W91-02785 7B

KRIGING
Estimation of the Transmissivity of the Santiago Aquifer, Chile, Using Different Geostatistical Methods.
W91-02679 2F

Combining Surface Geoelectrics and Borehole Measurements for Contamination Control.
W91-02685 5A

KUWAIT
Tidal and Turbidity Effects on the Shallow-Water Fish Assemblage of Kuwait Bay.
W91-02126 2L

LABORATORY METHODS
Toxicity Test for Water and Waste Water: Aldehyde Dehydrogenase Inhibition Test in Cuvets and Microtiter Plates (Toxizitaetstests fuer Wasser und Abwasser: Kuevetten- und Mikrotiterplattentest mit Aldehyddehydrogenase).
W91-02056 5A

Soluble Fluorescence: Effects on Chlorophyll Determination at Different Salinities.
W91-02065 2L

Preconcentration of Copper on Algae and Determination by Slurry Graphite Furnace Atomic Absorption Spectrometry.
W91-02191 5A

Enzyme-Linked Immunosorbent Assay Compared with Gas Chromatography/Mass Spectrometry for the Determination of Triazine Herbicides in Water.
W91-02192 5A

Detection of Organophosphorus Pesticide Detoxifying Bacterial Colonies, Using UV-Photography of Parathion-Impregnated Filters.
W91-02200 5B

Organic Solvent-Soluble Contents of Nickel and Cobalt in Some Algae.
W91-02401 5B

Simple Membrane Filter Method to Concentrate and Enumerate Male-Specific RNA Coliphages.
W91-02416 5A

Application of Direct Plaque Assay for Detection and Enumeration of Bacteriophages of Bacteroides fragilis from Contaminated-Water Samples.
W91-02770 5A

Geostatic Compaction Behaviour of Kaolin Muds--Effects of Different Sample Preparation Procedures.
W91-02802 2J

LAGOONS
Study on the Hydrology and Phytoplankton of the Varano Lake (Adriatic Sea) During an Annual Cycle (May 1985-April 1986). (Etude sur Lac de Varano (Mer Adriatique): Mai 1985-Avril 1986).
W91-02934 2L

LAKE ACIDIFICATION
Effects of Calcium and pH on the Reproductive Success of Amnicola limosa (Gastropoda).
W91-02064 5C

Lake Acidification and Fisheries Project: Brook Trout (Salvelinus fontinalis) Early Life Stages.
W91-02102 5C

Predation on Amphibian Eggs and Tadpoles by Common Predators in Acidified Lakes.
W91-02407 5C

LAKE ATHABASCA
Effect of Uranium Mine Tailings on Radionuclide Concentrations in Langley Bay, Saskatchewan, Canada.
W91-02460 5B

LAKE CHAD
Groundwater Recharge from Lake Chad.
W91-02591 2F

LAKE CLASSIFICATION
Classification of the Principal French Reservoirs.
W91-02385 2H

Water Quality in Czechoslovak Water-Supply Impoundments.
W91-02386 2H

Classification of Some Reservoirs in SR Serbia (SFR Yugoslavia) Based on Analysis of Plankton Species as Indicators of Trophic Conditions.
W91-02388 2H

LAKE CONSTANCE
Vertical Mixing in Uberlinger See, Western Part of Lake Constance.
W91-02450 2H

LAKE EVAPORATION
Simulation of Lake Evaporation with Application to Modeling Lake Level Variations of Harney-Malheur Lake, Oregon.
W91-02885 2H

LAKE FISHERIES
Lake Acidification and Fisheries Project: Brook Trout (Salvelinus fontinalis) Early Life Stages.
W91-02102 5C

Experimental Comparison of the Effects of Benthivorous Fish and Planktivorous Fish on Plankton Community Structure.
W91-02452 2H

LAKE GENEVA
Seasonal Delivery of the Particulate Forms of Phosphorus to Lake Geneva from the Upper Rhone River.
W91-02448 2H

LAKE MICHIGAN
Micrograzer Impact and Substrate Limitation of Bacterioplankton in Lake Michigan.
W91-02072 2H

Large-Lake Responses to Declines in the Abundance of a Major Fish Planktivore--The Lake Michigan Example.
W91-02073 2H

Short-Term Lethality and Sediment Avoidance Assays with Endrin-Contaminated Sediment and Two Oligochaetes from Lake Michigan.
W91-02199 5C

Population-Specific Toxicity Responses by the Freshwater Oligochaete, Stylodrilus heringianus, in Natural Lake Michigan Sediments.
W91-02213 5C

Microcontaminants and Reproductive Impairment of the Forster's Tern on Green Bay, Lake Michigan-1983.
W91-02441 5C

LAKE MORPHOLOGY
Classification of the Principal French Reservoirs.
W91-02385 2H

LAKE MORPHOMETRY
Ratios in Aquatic Sciences: Statistical Shortcomings with Mean Depth and the Morphoedaphic Index.
W91-02069 7C

Vertical Mixing in Uberlinger See, Western Part of Lake Constance.
W91-02450 2H

LAKE ONTARIO
Observations of the Niagara River Thermal Plume (Lake Ontario, North America).
W91-02832 2E

LAKE REHABILITATION
Bugle Lake Protection and Rehabilitation Project.
W91-02621 5G

LAKE RESTORATION
Large-Lake Responses to Declines in the Abundance of a Major Fish Planktivore--The Lake Michigan Example.
W91-02073 2H

Sewage Lagoon to Splendid Lakes.
W91-02425 5G

Short Term Response to Eutrophication Abatement.
W91-02447 5G

Free Ammonia and Toxicity Criteria in a Polluted Urban Lake.
W91-02536 5B

Evaluation of the Nutting Lake Dredging Program.
W91-02617 5G

Bugle Lake Protection and Rehabilitation Project.
W91-02621 5G

LAKE SEDIMENTS
Effects of Iron Cycling on Pb-210 Dating of Sediments in an Adirondack Lake, USA.
W91-02071 2J

Short-Term Lethality and Sediment Avoidance Assays with Endrin-Contaminated Sediment and Two Oligochaetes from Lake Michigan.
W91-02199 5C

Population-Specific Toxicity Responses by the Freshwater Oligochaete, Stylodrilus heringianus, in Natural Lake Michigan Sediments.
W91-02213 5C

Influence of Cage Rearing Pisciculture on Water Quality and Bottom Sediments in Artificial Lakes.
W91-02393 5C

Effects of Glacial Surging on Sedimentation in a Modern Ice-Contact Lake, Alaska.
W91-02520 2J

Sulfur Storage and Alkalinity Generation in New England Lake Sediments.
W91-02588 2H

LAKE SEVAN
Phosphorus Cycle and Its Significance in the Eutrophication of Lake Sevan.
W91-02376 5C

LAKE SHORES
Nourishment of Perched Sand Dunes and the Issue of Erosion Control in the Great Lakes.
W91-02821 2J

LAKE VATTERN
Re-Examination of Seiche Periods of Lake Vattern.
W91-02593 2H

LAKE ZURICH
Planktoneustonic Algae in the Surface Films of Lake Zurich: Occurrence and Dependence on Phytoplankton Succession.
W91-02451 2H

LAKES
Reciprocal Diel Vertical Migration Behavior in Planktivores and Zooplankton in British Columbia Lakes.
W91-02067 2H

Estimates of Ground-Water Flow Components for Lyman Lake, Apache County, Arizona, with a Section on Geochemistry of Surface Water and Ground Water in the Lyman Lake Area by Fredrick N. Robertson.
W91-02231 2F

Fathometer Data from Bart Lake and Lake Dorothy Near Juneau, Alaska, 1988-89.
W91-02254 7C

Diel and Seasonal Energy Transfer, Storage and Stratification in African Reservoirs and Lakes.
W91-02370 2H

Climate and Climatic Resources of Reservoirs.
W91-02373 2H

Toxicity of Chlorinated Bornane (Toxaphene) Residues Isolated from Great Lakes Lake Trout (Salvelinus namaycush).
W91-02435 5C

Coongie Lakes Control Zone--A Map and Note for the Surface Geology and Terrain.
W91-02531 2H

Quantitative Assessment of the Sources and General Dynamics of Trace Metals in a Soft-Water Lake.
W91-02587 5B

Integrated Approach to Quantify Groundwater Transport of Phosphorus to Narrow Lake, Alberta.
W91-02589 2F

Volunteer Lake Monitoring Program, 1988. Volume VI: Southwestern Illinois Region.
W91-02618 7B

Geochemical Control of Aluminium Concentrations in Acidified Surface Waters.
W91-02752 5B

Estimating Groundwater Exchange with Lakes: 1. The Stable Isotope Mass Balance Method.
W91-02873 2F

Estimating Groundwater Exchange with Lakes: 2. Calibration of a Three-Dimensional, Solute Transport Model to a Stable Isotope Plume.
W91-02874 2F

Study on the Hydrology and Phytoplankton of the Varano Lake (Adriatic Sea) During an Annual Cycle (May 1985-April 1986). (Etude sur Lac de Varano (Mer Adriatique): Mai 1985-Avril 1986).
W91-02934 2L

LAMPREY
Occurrence, Relative Abundance, and Size of Landlocked Sea Lamprey (Petromyzon marinus) Ammocoetes in Relation to Stream Characteristics in the Great Lakes.
W91-02068 2H

LAND CLASSIFICATION
Applied Land Classification for Surface Water Quality Management: I. Watershed Classification.
W91-02947 5G

Applied Land Classification for Surface Water Quality Management: II. Land Process Classification.

W91-02255 7C

Difference Between the Potentiometric Surface of the Magothy Aquifer of September 1986 and September 1988 in Southern Maryland.
W91-02256 7C

Potentiometric Surface of the Aquia Aquifer in Southern Maryland During September 1988.
W91-02257 7C

Coongie Lakes Control Zone--A Map and Note for the Surface Geology and Terrain.
W91-02531 2H

MARINE ANIMALS
Uptake of Cadmium and Nickel in Banana Prawn (Penaeus merguiensis de Man).
W91-02093 5B

Influence of Physiological Condition on Cadmium Transport from Haemolymph to Hepatopancreas in Carcinus maenas.
W91-02124 5B

Control of Meiobenthic Abundance by Macroepifauna in a Subtidal Muddy Habitat.
W91-02127 2L

Effects of Wastewater Treatment and Seawater Dilution in Reducing Lethal Toxicity of Municipal Wastewater to Sheepshead Minnow (Cyprinodon variegatus) and Pink Shrimp (Penaeus duorarum).
W91-02535 5D

MARINE BACTERIA
Attached and Free-Living Dividing Bacteria in Two Aquatic Systems.
W91-02121 2H

Carbon Budgets of the Microbial Food Web in Estuarine Enclosures.
W91-02125 2L

MARINE ENVIRONMENT
Macrobenthic Population of the Port of Algiers (Les Peuplements Macro Benthiques du Port d'Alger).
W91-02054 5B

Tidal and Turbidity Effects on the Shallow-Water Fish Assemblage of Kuwait Bay.
W91-02126 2L

Control of Meiobenthic Abundance by Macroepifauna in a Subtidal Muddy Habitat.
W91-02127 2L

Anthropogenic Influence on the Interelemental Correlation in Different Phases of the Marine Environment.
W91-02175 5B

Acute Toxicity of Industrial Surfactants to Mysidopsis bahia.
W91-02445 5C

MARINE POLLUTION
Evaluation of the Sea Urchin Echinometra Iucunter as an Indicator of Heavy-Metal Contamination in Cuba (Evaluacion del Erizo de Mar Echinometra Iucunter como Indicator de Contaminacion por Metales Pesados, Cuba).
W91-02044 5A

Analytical Approach to Assessment of Long-Term Effects of Low Levels of Contaminants in the Marine Environment.
W91-02554 5A

Persistence of Spilled Crude Oil in a Tropical Intertidal Environment.
W91-02556 5B

Hydrocarbon Concentrations in Sediments and Animal Tissues from the Coastal Waters of Karachi.
W91-02558 5B

Oil Pollution in the Southern Arabian Gulf and Gulf of Oman.
W91-02559 5B

MARSH PLANTS
Elevated Atmospheric CO2 Effects on Belowground Processes in C3 and C4 Estuarine Marsh Communities.
W91-02406 5C

MARSHES
Analysis of Long-Term Salinity Patterns in the Louisiana Coastal Zone.
W91-02762 2L

MARYLAND
Difference Between the Potentiometric Surface of the Aquia Aquifer of September 1986 and September 1988 in Southern Maryland.
W91-02255 7C

Difference Between the Potentiometric Surface of the Magothy Aquifer of September 1986 and September 1988 in Southern Maryland.
W91-02256 7C

Potentiometric Surface of the Aquia Aquifer in Southern Maryland During September 1988.
W91-02257 7C

Superfund Record of Decision: Southern Maryland Wood, MD. First Remedial Action--Final.
W91-02662 5G

MASS BALANCE
Use of Oxygen-18 and Deuterium Mass-Balance Analysis to Evaluate Induced Recharge to Stratified-Drift Aquifers.
W91-02287 2F

Estimating Groundwater Exchange with Lakes: 1. The Stable Isotope Mass Balance Method.
W91-02873 2F

MASS SPECTROMETRY
Enzyme-Linked Immunosorbent Assay Compared with Gas Chromatography/Mass Spectrometry for the Determination of Triazine Herbicides in Water.
W91-02192 5A

Liquid Chromatography-Mass Spectrometry: An Emerging Technology for Nonvolatile Compounds.
W91-02417 5A

Pyrolysis-GC-MS for Investigating High-Molecular-Weight THM Precursors and Other Refractory Organics.
W91-02418 5F

MASS TRANSFER
Modeling the Mass-Transfer Rate of Radioactive Cobalt from a Synthetic Groundwater to Volcanic Tuff Media.
W91-02163 5B

MASSACHUSETTS
Water Resources Data for Massachusetts and Rhode Island, Water Year 1988.
W91-02629 7C

Superfund Record of Decision: Cannon Engineering, MA. First Remedial Action--Final.
W91-02655 5G

Siting and Technology Pose Challenges for Communities Ending Ocean Disposal of Sludge.
W91-02955 5D

MASSACHUSETTS BAY
Toxicity Evaluation of the Proposed Secondary and the Primary Effluents Discharged to Massachusetts Bay.
W91-02101 5B

MATERIALS TESTING
Wastewater Treatment, The Utilization of Earth Materials as Coagulants.
W91-02412 5D

Surface Treatments to Minimize Concrete Deterioration. Report 2: Laboratory Evaluation of Surface Treatment Materials.
W91-02611 8F

MATHEMATICAL ANALYSIS
Parameterization of the Accretion Process between Different Precipitation Elements.
W91-02120 2B

Simplified Method to Estimate Regional 24-h Evapotranspiration from Thermal Infrared Data.
W91-02129 2D

Soil Water Diffusivity Determination by a Modified One-Step Outflow Method.
W91-02140 2G

Accurate Method for Calculation of Saturation DO.
W91-02577 5G

MATHEMATICAL EQUATIONS
Modeling Inactivation of Giardia lamblia.
W91-02570 5F

Accurate Method for Calculation of Saturation DO.
W91-02577 5G

First Step Away from Lacey's Regime Equations.
W91-02924 8B

MATHEMATICAL MODELS
Modelling Phytoplankton Productivity in Turbid Waters with Small Euphotic to Mixing Depth Ratios.
W91-02115 2H

Application of Two-Site/Two-Region Models for Studying Simultaneous Nonequilibrium Transport and Degradation of Pesticides.
W91-02132 5B

Coupled Water and Heat Transport in Ridged Soils.
W91-02133 2G

Adsorptive Solute Transport in Fractured Rock: Analytical Solutions for Delta-Type Source Conditions.
W91-02164 5B

Curious Behavior of a Groundwater Flow Model.
W91-02190 2F

Mass-Conserving Method of Characteristics for Streamflow Modeling.
W91-02234 2E

Fractal Approach to Spatial Variability of West African Rainfall Events (Approche Fractale de la Variabilite Spatiale des Episodes Pluvieux de l'Afrique de l'Ouest).
W91-02301 2B

Turbulent Flow Theory for African Regoliths.
W91-02344 2F

Modeling Inactivation of Giardia lamblia.
W91-02570 5F

Bounded Implicit Enumeration for Wastewater-Treatment Systems.
W91-02574 5D

Localized Adjoint Methods: Application to Advection Dominated Flows.
W91-02702 2F

Aquifer Thermal Energy Storage: A Numerical Simulation of Field Experiments in China.
W91-02866 4B

Uncertainty Propagation with Numerical Models for Flow and Transport in the Unsaturated Zone.
W91-02875 2G

Modeling Infiltration into a Sealing Soil.
W91-02878 2G

Coupled Inverse Problems in Groundwater Modeling: 1. Sensitivity Analysis and Parameter Identification.
W91-02879 7C

Coupled Inverse Problems in Groundwater Modeling: 2. Identifiability and Experimental Design.
W91-02880 7C

Numerical Simulation of Solute Transport in Three-Dimensional, Randomly Heterogeneous Porous Media.
W91-02881 5B

Application of the Arnoldi Algorithm to the Solution of the Advection-Dispersion Equation.
W91-02883 5B

Stochastic Analysis of the Concentration Variability in a Three-Dimensional Heterogeneous Aquifer.
W91-02884 2F

Modeling Channel Bed Transients Using Explicit F-D Schemes.
W91-02918 2E

Simulation of Downhole and Crosshole Seismic Tests on Sand Using the Hydraulic Gradient Similitude Method.
W91-02939 7B

Compressive Strength Behavior of Fine-Grained Frozen Soils.
W91-02940 8D

Contaminant Migration Through Fractured Till into an Underlying Aquifer.
W91-02941 5B

Hydraulic Fracture in Earth and Rock-Fill Dams.
W91-02942 8A

Migration of Pollutants in Groundwater: IV. Modeling of the Pumping of Contaminants from Fractured Bedrock.
W91-02945 2F

MEASURING INSTRUMENTS
Soluble Fluorescence: Effects on Chlorophyll Determination at Different Salinities.
W91-02065 2L

Monitoring System for Detecting Movements of Penstock Supports.
W91-02113 8G

Quantifying the Water Balance of Dryland Millet in Niger Using State of the Art Evaporation Techniques.
W91-02316 3F

New Instruments for Electrical and Audiomagnetotelluric Prospecting (Caracteristiques des Equipements Modernes de Prospection Geophysique par Methods Electrique ou Audiomagnetotellurique).
W91-02326 7B

Geophysical Methodology Applied to Rural Water Supply in Bedrock Environment: Preliminary Results (Methodologie Geophysique Appliquee a l'Hydraulique Villageoise en Zone de Socle: Resultats Preliminaires).
W91-02328 2F

New Liquid-Junction Free Probe for the In Situ Determination of pH, pH2S and Redox Values.
W91-02788 7B

Computer-Controlled 36-Channel Time Domain Reflectometry System for Monitoring Soil Water Contents.
W91-02861 2G

Computer-Controlled Automated Rain Sampler (CCARS) for Rainfall Measurement and Sequential Sampling.
W91-02914 7B

MEASURING TECHNIQUES
Calibration of Time Domain Reflectometry for Water Content Measurement Using a Composite Dielectric Approach.
W91-02857 2G

MECHANICAL ENGINEERING
Upgrading Procurement Specifications for Hydroelectric Machines.
W91-02158 8C

MEDAKA
Stage Specific Toxicity of 2,3,7,8-Tetrachlorodibenzo-p-Dioxin in Embryos of the Japanese Medaka (Oryzias latipes).
W91-02215 5C

MEDITERRANEAN SEA
Trace Metals in the Western Mediterranean Sea
W91-02179 5I

MEMBRANE FILTERS
Simple Membrane Filter Method to Concentrate and Enumerate Male-Specific RNA Coliphages
W91-02416 5A

MEMPHIS AQUIFER
Altitude of Potentiometric Surface, Fall 1985 and Historic Water-Level Changes in the Memphis Aquifer in Western Tennessee.
W91-02224 2

MERCURY
Electron Microscopy Documenting the Cellular Metabolic Fate of Hg Ions.
W91-02171 5

Mercury Accumulation in Relation to Size and Age of Atlantic Herring (Clupea harengus harengus) from the Southwestern Bay of Fundy, Canada.
W91-02433 5

Cost Supplement to Technologies and Costs for the Removal of Mercury from Potable Water Supplies.
W91-02725 5

Monitoring and Assessment of Mercury Pollution in the Vicinity of a Chloralkali Plant: Distribution, Availability and Genotoxicity of Sediment Mercury in the Rushikulya Estuary, India.
W91-02932 5

MESIP MODEL
MESIP: Modelling Environmental Scenarios in Ponds.
W91-02176 7

MESOCOSMS
Laboratory Mesocosm Studies of Fe, Al, Mn, Ca, and Mg Dynamics in Wetlands Exposed to Synthetic Acid Coal Mine Drainage.
W91-02091 5

LIBRARY U. OF I. UNDER SECRETARY

METABOLISM
Influence of the Herbicide Paraquat 'Gramaxon' on Growth and Metabolic Activity of Three Chlorophytes.
W91-02085 4A

METABOLITES
S-Oxygenation of Thiobencarb (Bolero) in Hepatic Preparations from Striped Bass (Morone saxatilis) and Mammalian systems.
W91-02552 5C

METAL COMPLEXES
Analytical Properties of 4,4'-Biazobenzenediazoaminobenzene and Its Applications in Spectrophotometry.
W91-02548 5A

METALS
Metal-Organic Associations in Sediments--I. Comparison of Unpolluted Recent and Ancient Sediments and Sediments Affected by Anthropogenic Pollution.
W91-02891 5B

Metal-Organic Associations in Sediments--II. Algal Mats in Contact with Geothermal Waters.
W91-02892 2J

METAMORPHOSIS
Artificially Induced Metamorphosis Acetone in Acris gryllus.
W91-02201 5C

METEOROLOGICAL DATA
Precipitation Fluctuation over Semiarid Regions in Northern China and the Relationship with El Nino/Southern Oscillation.
W91-02446 2B

Estimation of the Contribution of the Sulfate Ion to Rainwater Acidity.
W91-02827 5B

METEOROLOGICAL DATA COLLECTION
Electronics and Informatics for the Acquisition of Hydrometeorological Data: A Great Tool for Water Resource Management in the Sahel (Electronique et Informatique pour l'Acquisition des Donnees Hydrometeorologiques, un Outil Prodigieux pour la Gestion des Ressources en Eau dans le Sahel).
W91-02303 7B

METEOROLOGY
Fractal Approach to Spatial Variability of West African Rainfall Events (Approche Fractale de la Variabilite Spatiale des Episodes Pluvieux de l'Afrique de l'Ouest).
W91-02301 2B

Analysis of Non-Stationarity of West African Rainfall and Hydrological Series (Analyse de la Non Stationnarite des Series Pluviometriques et Hydrologiques d'Afrique de l'Ouest).
W91-02302 2B

Use of Cluster Analysis to Define Periods of Similar Meteorology and Precipitation Chemistry in Eastern North America: Part I. Transport Patterns.
W91-02409 5B

Use of Cluster Analysis to Define Periods of Similar Meteorology and Precipitation Chemistry in Eastern North America: Part II. Precipitation Patterns and Pollution Deposition.
W91-02410 5B

Precipitation Fluctuation over Semiarid Regions in Northern China and the Relationship with El Nino/Southern Oscillation.
W91-02446 2B

Some Characteristics of Point Discharge Current during Two Pre-Monsoon Season Thunderstorms at Pune.
W91-02553 2B

Doppler-Radar Analysis of a Low-Precipitation Severe Storm.
W91-02760 2B

Tropical Squall Line Observed During the COPT 81 Experiment in West Africa. Part III: Heat and Moisture Budgets.
W91-02761 2B

Liquid Water Content and Precipitation Characteristics of Stratiform Clouds as Inferred from Satellite Microwave Measurements.
W91-02835 2B

Passive Microwave Remote Sensing of Cloud Liquid Water Over Land Regions.
W91-02836 2B

Rainfall and Surface Kinematic Conditions Over Central Amazonia During ABLE 2B.
W91-02841 2B

METHANE
Sediment Oxygen Demand Model: Methane and Ammonia Oxidation.
W91-02576 2H

In-Situ Aquifer Restoration of Chlorinated Aliphatics by Methanotrophic Bacteria.
W91-02650 5G

Seasonal Dynamics in Methane Emissions from the Amazon River Floodplain to the Troposphere.
W91-02834 2H

Methane Flux from the Amazon River Floodplain: Emissions During Rising Water.
W91-02837 2H

METHANE BACTERIA
Interaction between Sulfate Reducers and Methanogens Fed Acetate and Propionate.
W91-02537 5D

In-Situ Aquifer Restoration of Chlorinated Aliphatics by Methanotrophic Bacteria.
W91-02650 5G

METHANOGENESIS
Methanogenic Toxicity of Wood Resin Constituents.
W91-02777 5D

Kinetic Study on Methanogenesis by Attached Biomass in a Fluidized Bed.
W91-02792 5D

METHYL PARATHION
Methylparathion-Induced Alterations in the Acetylcholinesterase and Phosphatases in a Penaeid Prawn, Metapenaeus monoceros.
W91-02097 5C

METROPOLITAN WATER MANAGEMENT
Potential for Expert Systems in Water Utility Operation and Management.
W91-02415 5F

Madrid Miocene Aquifer as a Component of the Metropolitan Water Supply System.
W91-02718 4B

Alluvial Aquifer of the Grand Gravier (Rhone Valley, France) Modelling and Protection.
W91-02721 5G

MEXICO
Behaviour of Francis Units Under Partial Loads.
W91-02157 8C

MICHIGAN
Superfund Record of Decision: Mason County Landfill, MI. First Remedial Action.
W91-02660 5G

Low-Tech, Low-Cost Solution to Treatment in St. Ignace, Mich.
W91-02953 5D

MICROBIAL DEGRADATION
Modeling of Multicomponent Transport with Microbial Transformation in Groundwater: The Fuhrberg Case.
W91-02180 5B

Detection of Organophosphorus Pesticide Detoxifying Bacterial Colonies, Using UV-Photography of Parathion-Impregnated Filters.
W91-02200 5B

Microbial Numbers and Activity During Infiltration of Septic-Tank Effluent in a Subsurface Sand Filter.
W91-02789 5D

MICROCOMPUTERS
Use of Personal Computers for the Analysis and Management of Hydrometeorological and Groundwater Data.
W91-02351 7C

MICROCYSTIS
Degradation of Blue Green Alga, Microcystis Aeruginosa by Flagellata, Monas Guttula.
W91-02826 5F

MICROORGANISMS
Effect of Water Quality on Bacterioplankton Densities in River, Brook and Peat Mining Water in the Basin of the Humic River Kiiminkijoki, Northern Finland.
W91-02455 5C

Production of Dissolved DNA, RNA, and Protein by Microbial Populations in a Florida Reservoir.
W91-02766 2H

Microbial Colonization of Aquifer Sediment Exposed in a Groundwater Well in Northern Germany.
W91-02767 2F

Decontamination Technologies for Release from Bioprocessing Facilities: Part VI. Verification of Wastewater Decontamination.
W91-02937 5D

Impact of Distillery Effluent Application to Land on Soil Microflora.
W91-02946 5C

MICROTOX ASSAY
Assessing Detoxification of a Complex Hazardous Waste, Using the Microtox Bioassay.
W91-02204 5E

MICROWAVES
Liquid Water Content and Precipitation Characteristics of Stratiform Clouds as Inferred from Satellite Microwave Measurements.
W91-02835 2B

Passive Microwave Remote Sensing of Cloud Liquid Water Over Land Regions.
W91-02836 2B

Decontamination Technologies for Release from Bioprocessing Facilities: Part V. Decontamination of Sludge.
W91-02936 5D

MIDDLE EAST
Activated Sludge Process: A Proposed Method to Predict Process Parameters.
W91-02791 5D

MIDGES
Toxicity of Inorganic and Organic Selenium to Daphnia magna (Cladocera) and Chironomus riparus (Diptera).
W91-02216 5C

Acute Toxicity of Aqueous and Substrate-Bound Copper to the Midge, Chironomus decorus.
W91-02430 5C

LIBRARY U. S. GEOLOGICAL SURVEY

MIDGES

Chronic Toxicity of Copper to a Partial Life Cycle of the Midge, Chironomus decorus.
W91-02431 5C

MIGRATION

Reciprocal Diel Vertical Migration Behavior in Planktivores and Zooplankton in British Columbia Lakes.
W91-02067 2H

MINE DRAINAGE

Summary of Biological Investigations Relating to Surface-Water Quality in the Kentucky River Basin, Kentucky.
W91-02232 5C

MINE WASTES

Lead, Zinc, Cadmium, and Fluoride in Small Mammals from Contaminated Grassland Established on Fluorospar Tailings.
W91-02082 5B

Geochemistry of Batch-Extract Waters Derived from Spoil Material Collected at the Cordero Coal Mine, Powder River Basin, Wyoming.
W91-02222 5B

U. S. Geological Survey Applied Research Studies of the Cheyenne River System, South Dakota: Description and Collation of Data, Water Years 1987-88.
W91-02235 5B

Effect of Uranium Mine Tailings on Radionuclide Concentrations in Langley Bay, Saskatchewan, Canada.
W91-02460 5B

Superfund Record of Decision: United Nuclear Corporation, NM. First Remedial Action.
W91-02661 5G

Laboratory Investigation of Beach Profiles in Tailings Disposal.
W91-02919 5E

MINERALS

Flume Experiments on the Transport of Heavy Minerals in Gravel-Bed Streams.
W91-02928 2J

MISSISSIPPI RIVER

Comparative Study of the Response of Taxodium distichum and Nyssa aquatica Seedlings to Soil Anaerobiosis and Salinity.
W91-02500 2E

Mississippi River-Gulf Outlet, Louisiana: Field Data Report.
W91-02604 2E

Disturbance and Recovery of Large Floodplain Rivers.
W91-02907 2H

MISSOURI

Sewage Lagoon to Splendid Lakes.
W91-02425 5G

Water Resources Data for Missouri, Water Year 1989.
W91-02630 7C

Superfund Record of Decision: Findett, Mo. First Remedial Action.
W91-02657 5G

MISSOURI RIVER

Missouri River Management Project: Learning to Cooperate.
W91-02264 6A

MIXING

Conservative Mixing of Water Sources: Analysis of the Behaviour of the Allt a'Mharcaidh Catchment.
W91-02756 2K

Experimental Investigation of Variable Density Flow and Mixing in Homogeneous and Heterogeneous Media.
W91-02862 2F

Origin and Evolution of Formation Waters, Alberta Basin, Western Canada Sedimentary Basin. II. Isotope Systematics and Water Mixing.
W91-02889 2K

MOBILE BAY

Evaluation of Loading and Dredged Material Overflow from Mechanically Filled Hopper Barges in Mobile Bay, Alabama.
W91-02609 5E

MODEL STUDIES

Ratios in Aquatic Sciences: Statistical Shortcomings with Mean Depth and the Morphoedaphic Index.
W91-02069 7C

Solute Transport Through Saturated Soils: A Study of the Physical Non-Equilibrium Model.
W91-02090 5B

Modelling Phytoplankton Productivity in Turbid Waters with Small Euphotic to Mixing Depth Ratios.
W91-02115 2H

Scheme for Parameterizing Ice-Cloud Water Content in General Circulation Models.
W91-02118 2C

Coupled Water and Heat Transport in Ridged Soils.
W91-02133 2G

Pore Pressure Field Built Up in a Rapidly Eroded Soil Mass.
W91-02149 8D

Modeling the Mass-Transfer Rate of Radioactive Cobalt from a Synthetic Groundwater to Volcanic Tuff Media.
W91-02163 5B

EXAMS 2: Exposure Analysis Modeling System.
W91-02174 7B

MESIP: Modelling Environmental Scenarios in Ponds.
W91-02176 7C

Modeling of Multicomponent Transport with Microbial Transformation in Groundwater: The Fuhrberg Case.
W91-02180 5B

Universal Scaling of Hydraulic Conductivities and Dispersivities in Geologic Media.
W91-02183 2F

New Method to Determine Regional Evapotranspiration.
W91-02184 2D

Comparison of Darcian Flow in Corresponding Flat and Folded Surfaces.
W91-02186 2F

Curious Behavior of a Groundwater Flow Model.
W91-02190 2F

Geochemistry of Batch-Extract Waters Derived from Spoil Material Collected at the Cordero Coal Mine, Powder River Basin, Wyoming.
W91-02222 5B

Analysis of Water Surface and Flow Distribution for the Design Flood at a Proposed Highway Crossing of the Sabine River Near Tatum, Texas.
W91-02226 2E

Mass-Conserving Method of Characteristics for Streamflow Modeling.
W91-02234 2E

Development of Theoretical Hydrology in West Africa (Developpement de l'Hydrologie Theorique en Afrique de l'Ouest).
W91-02289 2A

Hydrological Modelling for Water Management in Arid and Semi-arid Areas of Africa.
W91-02291 2A

Fractal Approach to Spatial Variability of West African Rainfall Events (Approche Fractale de la Variabilite Spatiale des Episodes Pluvieux de l'Afrique de l'Ouest).
W91-02301 2B

Problem of Water Balance Modelling under Semi-arid Conditions.
W91-02307 7C

Some Examples of Important Problems Connected to Rainfall-Runoff Modelling in Semi-Arid Zone.
W91-02308 7C

Unit Hydrograph Technique Applied to Sahelian Flood Modeling: Comparison of Different Identification Methods (L'Hydrogramme Unitaire Applique a l'Analyse des Crues au Sahel: Comparaison de Differentes Methodes d'Identification).
W91-02309 2E

Use of a Distributed Model of a Small Savannah Catchment (Booro-Borotou, Ivory Coast) Utilisation d'un Modele Distribue sur un Petit Bassin Versant de Savane (Booro-Borotou, Cote d'Ivoire).
W91-02310 2A

Analysis of the Speed of Propagation of Flood Waves (Analyse de la Vitesse de Propagation des Ondes de Crues).
W91-02311 2E

Hydraulic Properties of Four Soils in Niger and Implications for Water Balance Studies.
W91-02330 2G

Turbulent Flow Theory for African Regoliths.
W91-02344 2F

Global Modelling of the Rain-Runoff Relationship: A Tool for Evaluation of Water Resources (Modelisation Globale de la Relation Pluie Debit: des Outils au Service de l'Evaluation des Ressources en Eau).
W91-02349 2E

Scientific and Technical Evaluation of Mathematical Models in the Planning Design and Operation of Hydrosystems in Africa.
W91-02350 2E

Systems Engineering Approach to Solutions of Drought in Developing Countries: The Case of Tanzania.
W91-02361 2A

Prediction on Eutrophication of Reservoir Yuqiao.
W91-02383 5G

Relating Empirical Water Quality Diagrams and Plankton-Dynamical Models: The SAMPLE Methodology Applied to a Drinking Water Storage Reservoir.
W91-02395 5F

Estimates of Evapotranspiration with a One- and Two-Layer Model of Heat Transfer over Partial Canopy Cover.
W91-02408 2D

Short Term Response to Eutrophication Abatement.
W91-02447 5G

Frequency-Related Temporally and Spatially Varied Rainfall.
W91-02524 2B

Watershed Delineation with Triangle-Based Terrain Models.
W91-02525 2E

Field Verification of 2-D and 3-D Suspended-Sediment Models.
W91-02527 2J

Supercomputers and Their Use in Modeling Subsurface Solute Transport.
W91-02543 7C

Simple Solutions for Steady-State Biofilm Reactors.
W91-02569 5D

Bounded Implicit Enumeration for Wastewater-Treatment Systems.
W91-02574 5D

Sediment Oxygen Demand Model: Methane and Ammonia Oxidation.
W91-02576 2H

Study of Embankment Performance During Overtopping and Throughflow. Report 1: Feasibility Study.
W91-02603 8A

Study of Embankment Performance During Overtopping and Throughflow. Report 2: Hydraulic Study and Modeling of Models.
W91-02608 8B

Study of Embankment Performance During Overtopping and Throughflow. Report 3: Model-Prototype Comparison Studies.
W91-02610 8B

Annual Mean Transport in Puget Sound.
W91-02615 5B

Evaluation of Hydrogeological Parameters in Heterogeneous Porous Media.
W91-02673 2F

Some Aspects of Soil Moisture Control for Soils with Shallow Groundwater Levels.
W91-02674 2G

Indicator Conditional Simulation of the Architecture of Hydraulic Conductivity Fields: Application to a Sand-Shale Sequence.
W91-02676 2F

Groundwater Management by a Dual-Pipe Subirrigation System.
W91-02677 4B

Distribution of Aquifer Recharge from a Circular Spreading Basin under Transient Operations.
W91-02678 4B

Estimation of the Transmissivity of the Santiago Aquifer, Chile, Using Different Geostatistical Methods.
W91-02679 2F

Management of Groundwater-induced River Salinity due to Land Clearing in the Murray Basin, Southeastern Australia.
W91-02681 5G

Prediction of the Concentration Distribution of Groundwater Pollutants.
W91-02684 5B

Coupling of Chemistry and Transport.
W91-02694 5B

Identification of Unsaturated Solute Transport Parameters.
W91-02695 5B

Stochastic Control of Contaminant Transport Problems.
W91-02696 5G

Application of the Analytic Element Method for National Groundwater Management in The Netherlands.
W91-02697 6A

Management Model for Aquifer Recharge with Non-conservative Pollutants.
W91-02698 4B

Interactive Groundwater Modelling: Colour Graphics, ICAD and AI.
W91-02699 2F

Integrated Finite Difference Model for Groundwater Flow and Quality Simulation.
W91-02700 2F

Relevance of the Transport Parameters in Predictive Modelling of Groundwater Contamination.
W91-02701 5B

Localized Adjoint Methods: Application to Advection Dominated Flows.
W91-02702 2F

Finite Element Groundwater Model as Essential Planning Tool: Microbiological Denitrification of a Well Field at Broichhof.
W91-02703 5F

Target Level Groundwater Management Model with Linearized Flow and Transport Constraints.
W91-02704 2F

Numerical Model for Simulating the In-situ Volatilization of Hydrocarbon Contaminants in Soils.
W91-02705 5B

Modeling of Variable Density Flow, Application to the Management of Coastal Aquifers (Modelisation des Ecoulements a Densite Variable, Application a l'Exploitation des Aquiferes Cotiers).
W91-02706 2F

Optimal Groundwater Quality Management under Uncertainty: Incorporating the Effects of Spatial Variability of Hydraulic Conductivity.
W91-02708 5G

Role of Groundwater in Israel's Integrated Water System.
W91-02714 4B

Models for a Rational Utilization of High Quality Groundwater Resources.
W91-02715 3E

Finite Element Combined Surface Water/Groundwater Model for the River Rhine, Kehl/Strasbourg Reservoir.
W91-02716 5G

Madrid Miocene Aquifer as a Component of the Metropolitan Water Supply System.
W91-02718 4B

Application of Groundwater Modelling in Water Resources Management in Denmark.
W91-02719 5B

Ecosystem Modelling: Science or Technology.
W91-02736 2H

Modelling Streamwater Chemistry as a Mixture of Soilwater End-Members--A Step Towards Second-Generation Acidification Models.
W91-02753 5B

Modelling Streamwater Chemistry as a Mixture of Soilwater End-Members-An Application to the Panola Mountain Catchment, Georgia, U. S. A.
W91-02754 5B

Towards Developing a New Short-Term Model for the Birkenes Catchment--Lessons Learned.
W91-02758 2K

Regional Model of Acidification in Wales.
W91-02759 5B

Probability Model for Acid Rain Data.
W91-02787 5B

Sensitivity of the Surface Hydrology to the Complexity of the Land-surface Parameterization Scheme Employed.
W91-02804 7C

Large-scale Floodplain Modelling.
W91-02808 2E

Modeling Transient Substrate Loads in Completely Mixed Aeration Basins at Hydraulic Steady State.
W91-02822 5D

Withdrawal of Shelf Water into an Estuary: A Barotropic Model.
W91-02831 2L

Reliability Estimation in Modeling Watershed Runoff with Uncertainties.
W91-02858 2E

Spatial Uniformity of Power and the Altitudinal Geometry of River Networks.
W91-02860 2E

Aquifer Thermal Energy Storage: A Numerical Simulation of Field Experiments in China.
W91-02866 4B

Some Anomalous Features of Flow and Solute Transport Arising from Fracture Aperture Variability.
W91-02867 2F

Predicting Runoff from Rangeland Catchments: A Comparison of Two Models.
W91-02869 2E

Identification of Large-Scale Spatial Trends in Hydrologic Data.
W91-02870 7C

Stochastic Analysis of the Concentration Variability in a Three-Dimensional Heterogeneous Aquifer.
W91-02884 2F

Periodic-Stochastic Modeling of Separation of Precipitation into Rainfall and Snowfall.
W91-02886 2B

Modelling of the Evolution of Ground Waters in a Granite System at Low Temperature: The Stripa Ground Waters, Sweden.
W91-02893 2K

Biogeochemical Cycling Constraints on Stream Ecosystem Recovery.
W91-02906 2H

Island Biogeographical Theory: Can It Be Used to Predict Lotic Recovery Rates.
W91-02910 2E

Modeling Channel Bed Transients Using Explicit F-D Schemes.
W91-02918 2E

Analysis of Hydrologic Impact of Quarrying System by 3-D Finite Element Model.
W91-02921 4C

Gamma-Autoregressive Models for Stream-Flow Simulation.
W91-02922 2E

Bed Configurations in Steady Unidirectional Water Flows: Part I. Scale Model Study Using Fine Sands.
W91-02925 2E

Simulation of Downhole and Crosshole Seismic Tests on Sand Using the Hydraulic Gradient Similitude Method.
W91-02939 7B

Contaminant Migration Through Fractured Till into an Underlying Aquifer.
W91-02941 5B

Hydraulic Fracture in Earth and Rock-Fill Dams.
W91-02942 8A

Migration of Pollutants in Groundwater: IV. Modeling of the Pumping of Contaminants from Fractured Bedrock.
W91-02945 2F

Model to Predict and Assess the Effects of Groundwater Withdrawal on the Vegetation in the Pleistocene Areas of The Netherlands.
W91-02949 6G

MODEL TESTING
Field Verification of 2-D and 3-D Suspended-Sediment Models.
W91-02527 2J

MOISTURE CONTENT
Scheme for Parameterizing Ice-Cloud Water Content in General Circulation Models.
W91-02118 2C

Tropical Squall Line Observed During the COPT 81 Experiment in West Africa. Part III: Heat and Moisture Budgets.
W91-02761 2B

MOLECULAR STRUCTURE
Structure of an Anhydride Related to a Mutagenic Component of Drinking Water, 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone.
W91-02551 5A

MOLLUSKS
Influence of Sediment Disturbance and Water Flow on the Growth of the Soft-Shell Clam, Mya arenaria L.
W91-02062 2L

Effects of Calcium and pH on the Reproductive Success of Amnicola limosa (Gastropoda).
W91-02064 5C

Barium Bioaccumulation in Clams Collected from Different Salinity Regimes along the Saudi Coast of the Arabian Gulf.
W91-02094 5B

Asiatic Clam, Corbicula spp., as a Biological Monitor in Freshwater Environments.
W91-02944 5A

MONITORING
Monitoring System for Detecting Movements of Penstock Supports.
W91-02113 8G

Comparison of Quarter-Hourly On-Line Dynamic Headspace Analysis to Purge-and-Trap Analysis of Varying Volatile Organic Compounds in Drinking Water Sources.
W91-02219 5A

Agricultural Pesticides and Groundwater in North Carolina: Identification of the Most Vulnerable Areas.
W91-02245 5G

Periphyton as Indicator of the Reservoir Water Quality: III. Biomonitoring Techniques.
W91-02382 5A

Long-Term Monitoring of Polychlorinated Biphenyls in the Hudson River (New York) Using Caddisfly Larvae and Other Macroinvertebrates.
W91-02464 5B

Polychlorinated Biphenyl Congeners in Sediments, Plankton, Molluscs, Crustaceans, and Eel in a Freshwater Lake: Implications of Using Reference Chemicals and Indicator Organisms in Bioaccumulation Studies.
W91-02465 5B

Sensitivity Analysis of Nine Diversity and Seven Similarity Indices.
W91-02534 2H

Revision of the Saprobic System (Eine Revision des Saprobiensystems).
W91-02546 5G

Analytical Approach to Assessment of Long-Term Effects of Low Levels of Contaminants in the Marine Environment.
W91-02554 5A

Monitoring Program Assesses Water Quality Progress.
W91-02561 5D

Guidelines for Physical and Biological Monitoring of Aquatic Dredged Material Disposal Sites.
W91-02607 5A

Volunteer Lake Monitoring Program, 1988. Volume VI: Southwestern Illinois Region.
W91-02618 7B

Installation of a Multiport Ground-Water Sampling System in the 300 Area.
W91-02670 5A

Application of Direct Plaque Assay for Detection and Enumeration of Bacteriophages of Bacteroides fragilis from Contaminated-Water Samples.
W91-02770 5A

Indicators of Ecosystem Recovery.
W91-02896 5G

MONSOONS
Some Characteristics of Point Discharge Current during Two Pre-Monsoon Season Thunderstorms at Pune.
W91-02553 2B

MONTANA
Water Resources Data for Montana, Water Year 1989.
W91-02631 7C

MONTREAL
Foundation Problems in Champlain Clays During Droughts. I: Rainfall Deficits in Montreal (1930-1988).
W91-02147 8D

MORPHOEDAPHIC INDEX
Ratios in Aquatic Sciences: Statistical Shortcomings with Mean Depth and the Morphoedaphic Index.
W91-02069 7C

MORPHOLOGY
Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: I. 1,2,4-Trichlorobenzene.
W91-02436 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: II. 1,3,5-Trichlorobenzene.
W91-02437 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: III. 1,2,3-Trichlorobenzene.
W91-02438 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: IV. Pentachlorobenzene and Comparison with Trichlorobenzene Isomers.
W91-02439 5C

MORTALITY
Effects of Wastewater Treatment and Seawater Dilution in Reducing Lethal Toxicity of Municipal Wastewater to Sheepshead Minnow (Cyprinodon variegatus) and Pink Shrimp (Penaeus duorarum).
W91-02535 5D

MOSSES
Growth, Production, and Decomposition Dynamics of Sphagnum Under Natural and Experimentally Acidified Conditions.
W91-02404 5C

MOUNTAIN LAKES
Hydrology of Goat Lake Watershed, Snohomish County, Washington, 1982-87.
W91-02227 5B

Response of the Microbial Loop to Phytoplankton Spring Bloom in a Large Prealpine Lake.
W91-02584 2H

Characterization of Year-round Sensitivity of California's Montane Lakes to Acidic Deposition.
W91-02619 5B

MOUNTAIN STREAMS
Resistance to Flow in Steep Rough Streams.
W91-02920 2E

MULTIRESERVOIR NETWORKS
Annual and Longitudinal Changes in the Environmental Conditions in Three Consecutive Reservoirs of the Guadiana River (W. Spain).
W91-02372 2H

MULTIVARIATE ANALYSIS
Study on the Hydrology and Phytoplankton of the Varano Lake (Adriatic Sea) During an Annual Cycle (May 1985-April 1986). (Etude sur Lac de Varano (Mer Adriatique): Mai 1985-Avril 1986).
W91-02934 2L

MUNICIPAL WASTES
Effect of Sewage Sludge on Nutrient and Toxic Metal Content of Soil and Selected Crops Grown on Tropical Soils.
W91-02239 5C

Energy-Efficient Municipal Sludge Incineration.
W91-02563 5E

Performances of Digesters Treating the Organic Fraction of Municipal Solid Wastes Differently Sorted.
W91-02775 5D

MUNICIPAL WASTEWATER
Toxicity Evaluation of the Proposed Secondary and the Primary Effluents Discharged to Massachusetts Bay.
W91-02101 5B

Wastewater Treatment, The Utilization of Earth Materials as Coagulants.
W91-02412 5D

Effects of Wastewater Treatment and Seawater Dilution in Reducing Lethal Toxicity of Municipal Wastewater to Sheepshead Minnow (Cyprinodon variegatus) and Pink Shrimp (Penaeus duorarum).
W91-02535 5D

MUNICIPAL WATER
Key Factors in Taste and Odour Problems for Municipal Water Works Using Surface Water Sources.
W91-02394 5F

Monitoring Program Assesses Water Quality Progress.
W91-02561 5D

Investigation of Rest Area Requirements: Appendix-Pertinent Rest Area Literature.
W91-02620 5D

MUTAGENICITY
Rainbow Trout Liver Activation Systems with the Ames Mutagenicity Test.
W91-02217 5A

Comparative Evaluation of Five Toxicity Tests with Sediments from San Francisco Bay and Tomales Bay, California.
W91-02218 5A

Application of a Simple Short-Term Bioassay for the Identification of Genotoxins from Hazardous Wastes.
W91-02665 5A

MUTAGENS
Structure of an Anhydride Related to a Mutagenic Component of Drinking Water, 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone.
W91-02551 5A

MYTILUS
Methods for Assessing Fertilization and Embryonic/Larval Development in Toxicity Tests Using the California Mussel (Mytilus californianus).
W91-02212 5A

NARROW LAKE
Integrated Approach to Quantify Groundwater Transport of Phosphorus to Narrow Lake, Alberta.
W91-02589 2F

NATIONAL PRIMARY DRINKING WATER REGULAT
Information Collection Request for: National Primary Drinking Water Regulations for Inorganic Chemicals.
W91-02602 7B

NESTING
Microcontaminants and Reproductive Impairment of the Forster's Tern on Green Bay, Lake Michigan-1983.
W91-02441 5C

NETWORK DESIGN
Approximation of Confidence Limits on Sample Semivariograms from Single Realizations of Spatially Correlated Random Fields.
W91-02187 7C

Hydrological Network, Data Banks, and Teletransmission (Reseaux Hydrologiques, Banques de Donnees Informatisees et Teletransmission).
W91-02352 7B

Teletransmission of Hydrological Data Within the Framework of the Programme to Combat Onchocerciasis (Teletransmission des Donnees Hydrologiques dans le Cadre du Programme de Lutte Contre l'Onchocercose).
W91-02353 7B

Impact of Climatic Changes on Surface Water Resources in West and Central Africa (Impact des Changements Climatiques sur les Ressources en Eau de Surface en Afrique de l'Ouest et Centrale: L'Experience de l'OSTROM).
W91-02368 7A

Inventory and Monitoring of Forested-Wetland Resources of ASEAN.
W91-02476 2H

Sampling Intensity and Species Richness: Effects on Delineating Southwestern Riparian Plant Communities.
W91-02492 2H

Temporal Variability of Water Quality and the Implications for Monitoring Programmes in Irish Limestone Aquifers.
W91-02682 7A

Evaluation of Regional Flood Frequency Analysis with a Region of Influence Approach.
W91-02856 2E

Explicit Calculation of Pipe-Network Parameters.
W91-02917 8B

NEUSE RIVER
Stable Isotope Tracers of Nitrogen Sources to the Neuse River, North Carolina.
W91-02244 5C

NEVADA
Potential Hazards from Floodflows in Grapevine Canyon, Death Valley National Monument, California and Nevada.
W91-02230 2E

NEW ENGLAND
Sulfur Storage and Alkalinity Generation in New England Lake Sediments.
W91-02588 2H

NEW HAMPSHIRE
Longitudinal Patterns of Concentration-Discharge Relationships in Stream Water Draining the Hubbard Brook Experimental Forest, New Hampshire.
W91-02743 5B

NEW JERSEY
Fate of Parathion in Ground Water in Commercial Cranberry Culture in the New Jersey Pinelands.
W91-02098 5B

Estimated Demand for Agricultural Water for Use in New Jersey, 1990.
W91-02246 6D

Hydrogeologic Reconnaissance of the Swope Oil Superfund Site and Vicinity, Camden and Burlington Counties, New Jersey.
W91-02249 2F

Water Resources Data for New Jersey, Water Year 1989, Volume 1: Atlantic Slope Basins, Hudson River to Cape May.
W91-02632 7C

Water Resources Data for New Jersey, Water Year 1989, Volume 2: Delaware River Basin and Tributaries to Delaware Bay.
W91-02633 7C

Carbon Columns vs. the PACT Process for Priority-Pollutant Removal.
W91-02958 5D

NEW MADRID PUMPING STATION
New Madrid Pumping Station Gravity Flow Conduit and Confluence, New Madrid Floodway, Missouri: Hydraulic Model Investigation.
W91-02605 8B

NEW MEXICO
Southwestern Riparian Plant Communities: Site Characteristics, Tree Species Distributions, and Size-class Structures.
W91-02491 2H

Superfund Record of Decision: South Valley/Edmunds Street, NM. Second Remedial Action.
W91-02658 5G

Superfund Record of Decision: United Nuclear Corporation, NM. First Remedial Action.
W91-02661 5G

Superfund Record of Decision: South Valley/SJ-6, NM. Third Remedial Action.
W91-02664 5G

NEW SNOW
Glacial Mass Balance Determination in the Accumulation Zone by In situ Measurements of Tchernobyl Radioactivity (Determination du Bilan Glaciaire en Zone d'Accumulation par Mesure In Situ de la Radioactivite due a Tchernobyl).
W91-02052 2C

NEW YORK
Reconstruction and Dynamics of the Late Wisconsin 'Ontario' Ice Dome in the Finger Lakes Region, New York.
W91-02151 2C

Water Resources Data for New York, Water Year 1989, Volume 2: Long Island.
W91-02634 7C

NIAGARA RIVER
Observations of the Niagara River Thermal Plume (Lake Ontario, North America).
W91-02832 2E

NICKEL
Uptake of Cadmium and Nickel in Banana Prawn (Penaeus merguiensis de Man).
W91-02093 5B

Organic Solvent-Soluble Contents of Nickel and Cobalt in Some Algae.
W91-02401 5B

NIGER
Quantifying the Water Balance of Dryland Millet in Niger Using State of the Art Evaporation Techniques.
W91-02316 3F

Hydrogeological and Geophysical Electromagnetic Study of the Alluvial Aquifer of Wadi Teloua, Agadez, Niger (Etude Hydrogeologique et Geophysique Electromagnetique de la Nappe Alluviale du Kori Teloua, Agadez, Niger).
W91-02323 2F

Geophysical Reconnaissance in a Fissured Structure: Example in Liptako, Rep. Niger (Reconnaissance Geophysique en Milieu Fissure: Exemple au Liptako, Rep. Niger).
W91-02327 2F

Geophysical Methodology Applied to Rural Water Supply in Bedrock Environment: Preliminary Results (Methodologie Geophysique Appliquee a l'Hydraulique Villageoise en Zone de Socle: Resultats Preliminaires).
W91-02328 2F

Hydraulic Properties of Four Soils in Niger and Implications for Water Balance Studies.
W91-02330 2G

Hydrogeological Role of the Faults in the Valleys of the South of Air (Republic of Niger) (Sur les Roles Hydrogeologiques des Failles dans les Vallees du Sud d'Air (Republique du Niger)).
W91-02341 2F

Hydrological Education at the AGRHYMET Centre (La Formation en Hydrologie au Centre AGRHYMET).
W91-02364 6E

NIGER RIVER
Hydrology and River Control on the Niger and Senegal.
W91-02358 2E

NIGERIA
Water Resources Management in Nigeria: The River Basin Approach.
W91-02357 4A

Eutrophication of Nigeria's Lake Asejire.
W91-02384 5C

Hydrogeology and Water Chemistry in the Weathered Crystalline Rocks of Southwestern Nigeria.
W91-02691 2F

NILE DELTA
Speciation and Behavior of Arsenic in the Nile Delta Lakes.
W91-02087 5B

NILE RIVER
Analysis of Drought in Ethiopia Based on Nile River Flow Records.
W91-02299 2A

NILE RIVER BASIN
Water Losses in the Nile Basin.
W91-02298 2A

NITRATES
Stimulation of Biologically Active Zones (BAZ's) in Porous Media by Electron-Acceptor Injection.
W91-02161 5G

Transformation Kinetics of Trace-Level Halogenated Organic Contaminants in a Biologically Active Zone (BAZ) Induced by Nitrate Injection.
W91-02162 5G

Stable Isotope Tracers of Nitrogen Sources to the Neuse River, North Carolina.
W91-02244 5C

Nitrate in Groundwater.
W91-02689 5B

Cost Supplement to Technologies and Costs for the Removal of Nitrates and Nitrites from Potable Water Supplies.
W91-02726 5F

Large-Scale Biological Nitrate and Ammonia Removal.
W91-02843 5F

NITRITES
Cost Supplement to Technologies and Costs for the Removal of Nitrates and Nitrites from Potable Water Supplies.
W91-02726 5F

NITROGEN
Stable Isotope Tracers of Nitrogen Sources to the Neuse River, North Carolina.
W91-02244 5C

Patterns and Controls of Nitrogen in Tallgrass Prairie Streams.
W91-02405 2H

Impact of Nitrogen on the Adsorptive Capacity of Activated Charcoal.
W91-02825 5F

NITROGEN CYCLE
Measurement and Calculation of Dinitrogen Fixation in Water Bodies.
W91-02378 2K

Acid Depositions, Summer Droughts, Forest Decline: Development of the Nitrous Acid Hypothesis.
W91-02828 5C

NITROGEN FIXATION
Measurement and Calculation of Dinitrogen Fixation in Water Bodies.
W91-02378 2K

NITROPHENOLS
Biodegradation of p-Nitrophenol in an Aqueous Waste Stream by Immobilized Bacteria.
W91-02768 5D

NITROUS ACID
Acid Depositions, Summer Droughts, Forest Decline: Development of the Nitrous Acid Hypothesis.
W91-02828 5C

NONPOINT POLLUTION SOURCES
Source, Composition and Flux of Polycyclic Aromatic Hydrocarbons in Sediments of the River Derwent, Derbyshire, U.K.
W91-02079 5B

Speciation and Behavior of Arsenic in the Nile Delta Lakes.
W91-02087 5B

Septic Tank and Agricultural Non-Point Source Pollution Within a Rural Watershed.
W91-02177 5B

Persistence of DDT in the Yakima River Drainage, Washington.
W91-02457 5B

Effect of Field-scale Solute Infiltration into Groundwater on Surface Water Quality.
W91-02683 5B

Threat to Groundwater Quality by Pesticides in The Netherlands.
W91-02688 5B

Finite Element Groundwater Model as Essential Planning Tool: Microbiological Denitrification of a Well Field at Broichhof.
W91-02703 5F

NORTH AMERICA
Use of Cluster Analysis to Define Periods of Similar Meteorology and Precipitation Chemistry in Eastern North America: Part I. Transport Patterns.
W91-02409 5B

Use of Cluster Analysis to Define Periods of Similar Meteorology and Precipitation Chemistry in Eastern North America: Part II. Precipitation Patterns and Pollution Deposition.
W91-02410 5B

NORTH CAROLINA
Agricultural Pesticides and Groundwater in North Carolina: Identification of the Most Vulnerable Areas.
W91-02245 5G

NORTHERN IRELAND
European Environmental Directives--Implications for Northern Ireland.
W91-02851 5G

NORWAY
Limitations to the Understanding of Ion-Exchange and Solubility Controls for Acidic Welsh, Scottish, and Norwegian Sites.
W91-02735 5C

Evidence for Long-Term Deterioration of Streamwater Chemistry and Soil Acidification at the Birkenes Catchment, Southern Norway.
W91-02738 5C

Reversal of Stream Acidification at the Birkenes Catchment, Southern Norway: Predictions Based on Potential ANC Changes.
W91-02739 5B

Towards Developing a New Short-Term Mode
for the Birkenes Catchment--Lessons Learned
W91-02758 2K

NOVA SCOTIA
Pathogenic Marine Vibrio Species in Selecte
Nova Scotian Recreational Coastal Waters.
W91-02780 5

NUCLEAR POWERPLANTS
Gamma Emitters in Hong Kong Water.
W91-02816 5

NUCLEAR REACTORS
Accumulation from Water and Depuration o
110mAg by a Freshwater Fish, Salmo trutta L
W91-02798 5

NUCLEAR WASTES
Superfund Record of Decision: United Nuclea
Corporation, NM. First Remedial Action.
W91-02661 5

NUCLEIC ACIDS
Production of Dissolved DNA, RNA, and Pro
tein by Microbial Populations in a Florida Rese
voir.
W91-02766 2

NUMERICAL ANALYSIS
Applied Land Classification for Surface Wat
Quality Management: II. Land Process Classi
cation.
W91-02948 5

NUTRIENT REMOVAL
Microbial Numbers and Activity During Inf
tration of Septic-Tank Effluent in a Subsurfa
Sand Filter.
W91-02789 5

NUTRIENT TRANSPORT
Biologically Available Phosphorus Retention
the Kis-Balaton Reservoir.
W91-02375 2

NUTRIENTS
Monthly Variations of Dissolved Free Ami
Acids (DFAA) Observed in the Bay of Vil
franche-sur-Mer, France: Experimental Study
Their Uptake by Paracentrotus lividus a
Sphaerechinus granularis Larvae (Variatio
Mensuelles des Acides Amines Libres Disso
(AALD) Presents en un Point de la rade
Villefranche-sur-Mer: Utilisation par les Lar
de Paracentrotus lividus et de Sphaerechin
granularis).
W91-02047

Prediction on Eutrophication of Reserv
Yuqiao.
W91-02383

Eutrophication of Nigeria's Lake Asejire.
W91-02384

Seasonal Delivery of the Particulate Forms
Phosphorus to Lake Geneva from the Up
Rhone River.
W91-02448

Nutrients, Heavy Metals and Organic Micro
lutants in an Eutrophic Brazilian Lagoon.
W91-02555

Integrated Approach to Quantify Groundwa
Transport of Phosphorus to Narrow Lake,
berta.
W91-02589

Use of Kinetic Bioassay Procedure to Estim
Sulfate and Cysteine Concentrations in S
ment.
W91-02796

NUTTING LAKE
Evaluation of the Nutting Lake Dredging Program.
W91-02617 5G

OAK TREES
Precipitation, Throughfall, Soil Solution and Streamwater Chemistry in a Holm-Oak (Quercus ilex) Forest.
W91-02744 2K

OATS
Absence of Cadmium in the Blood of Horses Fed Oats Grown on Municipal Sludge-Amended Soil.
W91-02933 5E

OCEAN DUMPING
Diffusion and Dispersion in Coastal Waters.
W91-02521 5B

Assessment of Ocean Waste Disposal. Task 5. Human Health Impacts of Waste Constituents. II. Pathogens and Antibiotic-and Heavy Metal-Resistant Bacteria.
W91-02616 5E

ODOR CONTROL
Possible Importance of Wind Aeration in Controlling Odours from Piggery Slurry Stored after Aerobic Treatment.
W91-02772 5D

ODORS
Key Factors in Taste and Odour Problems for Municipal Water Works Using Surface Water Sources.
W91-02394 5F

OHIO
Ecology of a Southern Ohio Stream Receiving Fly Ash Pond Discharge: Changes from Acid Mine Drainage Conditions.
W91-02208 5C

Survey of Small Sewage Treatment Facilities in Ohio.
W91-02532 5D

OHIO RIVER
Toxic-Substance Control for the Ohio River.
W91-02564 5G

OIL FIELDS
Indicator Conditional Simulation of the Architecture of Hydraulic Conductivity Fields: Application to a Sand-Shale Sequence.
W91-02676 2F

OIL INDUSTRY
Assessing Detoxification of a Complex Hazardous Waste, Using the Microtox Bioassay.
W91-02204 5E

OIL POLLUTION
Weathered Crude Oil Effects on Chicks of Fork-Tailed Storm-Petrels (Oceanodroma furcata).
W91-02207 5C

Hydrocarbon Concentrations in Sediments and Animal Tissues from the Coastal Waters of Karachi.
W91-02558 5B

Oil Pollution in the Southern Arabian Gulf and Gulf of Oman.
W91-02559 5B

Oil Slick Sizes and Length of Coastline Affected: A Literature Survey and Statistical Analysis--Final Report.
W91-02671 5B

Hydrocarbon Pollution in Particle-Rich Waters (Gulf of Fos-sur-mer): Comparative Study of Extraction Procedures.
W91-02854 5A

OIL SPILLS
Persistence of Spilled Crude Oil in a Tropical Intertidal Environment.
W91-02556 5B

Oil Slick Sizes and Length of Coastline Affected: A Literature Survey and Statistical Analysis--Final Report.
W91-02671 5B

Numerical Model for Simulating the In-situ Volatilization of Hydrocarbon Contaminants in Soils.
W91-02705 5B

Transformation of Monoaromatic Hydrocarbons to Organic Acids in Anoxic Groundwater Environment.
W91-02818 5B

Effects of Oil Spills on Macro-Invertebrates of Saltmarshes and Mangrove Forests in Botany Bay, New South Wales, Australia.
W91-02912 5C

OLIGOCHAETES
Short-Term Lethality and Sediment Avoidance Assays with Endrin-Contaminated Sediment and Two Oligochaetes from Lake Michigan.
W91-02199 5C

Population-Specific Toxicity Responses by the Freshwater Oligochaete, Stylodrilus heringianus, in Natural Lake Michigan Sediments.
W91-02213 5C

ONCHOCERCIASIS
Teletransmission of Hydrological Data Within the Framework of the Programme to Combat Onchocerciasis (Teletransmission des Donnees Hydrologiques dans le Cadre du Programme de Lutte Contre l'Onchocercose).
W91-02353 7B

ONTARIO
Tritium, Oxygen-18, and Deuterium Diffusion at the Confederation Road Landfill Site, Sarnia, Ontario, Canada.
W91-02146 5B

Three-Dimensional Statistical Moment Analysis of the Stanford/Waterloo Borden Tracer Data.
W91-02182 5B

OPEN-CHANNEL FLOW
Mass-Conserving Method of Characteristics for Streamflow Modeling.
W91-02234 2E

Resistance to Flow in Steep Rough Streams.
W91-02920 2E

OPERATING POLICIES
Water Treatment Problems.
W91-02400 5F

Role of Groundwater in Israel's Integrated Water System.
W91-02714 4B

OPOSSUM-SHRIMP
Acute Toxicity of Industrial Surfactants to Mysidopsis bahia.
W91-02445 5C

OPTIMIZATION
Simplified Optimisation Procedure for Fixed Bed Adsorption Systems.
W91-02081 5D

New Approach for Optimization of Urban Drainage Systems.
W91-02575 5D

OREGON
Use of Geomorphology in the Classification of Riparian Plant Associations in Mountainous Landscapes of Central Oregon, U.S.A.
W91-02496 2H

Streamside Management Units in the Pacific Northwest.
W91-02497 6B

Simulation of Lake Evaporation with Application to Modeling Lake Level Variations of Harney-Malheur Lake, Oregon.
W91-02885 2H

ORGANIC CARBON
Hydrogeochemical Processes Controlling the Transport of Dissolved Organic Carbon Through a Forested Hillslope.
W91-02159 5B

Effect of Water Quality on Bacterioplankton Densities in River, Brook and Peat Mining Water in the Basin of the Humic River Kiiminkijoki, Northern Finland.
W91-02455 5C

ORGANIC CHEMICALS
MESIP: Modelling Environmental Scenarios in Ponds.

ORGANIC COMPOUNDS
Organic Selenium Distribution in Selected California Soils.
W91-02134 5B

Liquid Chromatography-Mass Spectrometry: An Emerging Technology for Nonvolatile Compounds.
W91-02417 5A

Pyrolysis-GC-MS for Investigating High-Molecular-Weight THM Precursors and Other Refractory Organics.
W91-02418 5F

Batch Biodegradation of Industrial Organic Compounds Using Mixed Liquor from Different POTWs.
W91-02540 5D

Fast Determination of the Biodegrability of Organic Compounds in a Laboratory-Trickling-Filter (Rasche Bestimmung des Bioabbaus Organischer Stoffe in einem Labor-Tropfkorper).
W91-02544 5D

Biodegradation of Toxic Organics: Status and Potential.
W91-02568 5D

Transformation of Monoaromatic Hydrocarbons to Organic Acids in Anoxic Groundwater Environment.
W91-02818 5B

ORGANIC MATTER
Performances of Digesters Treating the Organic Fraction of Municipal Solid Wastes Differently Sorted.
W91-02775 5D

Blackwater Perspective on Riverine Ecosystems.
W91-02778 2H

Seasonal Changes in Iron Transport and Nature of Dissolved Organic Matter in a Humic River in Northern Finland.
W91-02810 2K

Metal-Organic Associations in Sediments--I. Comparison of Unpolluted Recent and Ancient Sediments and Sediments Affected by Anthropogenic Pollution.
W91-02891 5B

Metal-Organic Associations in Sediments--II. Algal Mats in Contact with Geothermal Waters.
W91-02892 2J

ORGANIC POLLUTANTS
Nutrients, Heavy Metals and Organic Micropollutants in an Eutrophic Brazilian Lagoon.
W91-02555 5B

Removal and Fate of RCRA and CERCLA Toxic Organic Pollutants in Wastewater Treatment.
W91-02653 5D

Sediment-Water-Equilibria: The Sorption of Volatile Chlorinated Hydrocarbons and Dichloro Benzenes by Sediments. (Sediment-Wasser-Gleichgewichte: Verhalten fluchtiger Chlorkohlenwasserstoffe und der Dichlorbenzole an Gewassersedimenten).
W91-02668 5B

Asiatic Clam, Corbicula spp., as a Biological Monitor in Freshwater Environments.
W91-02944 5A

ORGANIC SOLVENTS
Superfund Record of Decision: Motorola (52nd Street Plant), AZ. First Remedial Action.
W91-02652 5G

ORGANOLEPTIC PROPERTIES
Key Factors in Taste and Odour Problems for Municipal Water Works Using Surface Water Sources.
W91-02394 5F

ORGANOMETALS
Toxic Effects of Tetraethyl Lead and Its Derivatives on the Chrysophyte Poteriochromonas malhamensis: VIII. Comparative Studies with Surfactants.
W91-02432 5C

ORGANOPHOSPHORUS PESTICIDES
Methylparathion-Induced Alterations in the Acetylcholinesterase and Phosphatases in a Penaeid Prawn, Metapenaeus monoceros.
W91-02097 5C

Detection of Organophosphorus Pesticide Detoxifying Bacterial Colonies, Using UV-Photography of Parathion-Impregnated Filters.
W91-02200 5B

Responses of Zooplankton and Chaoborus to Temephos in a Natural Pond and in the Laboratory.
W91-02203 5C

Photocatalytic Degradation of Organophosphorous Insecticides in Aqueous Semiconductor Suspensions.
W91-02799 5D

ORGANOTIN COMPOUNDS
Sublethal and Histopathological Effects of Trace Levels of Tributyltin Fluoride on Adult Oysters Crassostrea gigas.
W91-02045 5C

Tributyltin Retards Regeneration and Produces Deformities of Limbs in the Fiddler Crab, Uca pugilator.
W91-02434 5C

Differences Between Freshwater and Seawater-Acclimated Guppies in the Accumulation and Excretion of Tri-n-Butyltin Chloride and Triphenyltin Chloride.
W91-02793 5C

Comparative Survey of Imposex in Northeast Pacific Neogastropods (Prosobranchia) Related to Tributyltin Contamination, and Choice of a Suitable Bioindicator.
W91-02894 5A

ORINOCO RIVER
Venezuelan Floodplain Study on the Orinoco River.
W91-02478 2H

OVERFLOW
Evaluation of Loading and Dredged Material Overflow from Mechanically Filled Hopper Barges in Mobile Bay, Alabama.
W91-02609 5E

OVERLAND FLOW
Similarity and Length Scale for Spatially Varied Overland Flow.
W91-02189 2E

OVERTOPPING
Study of Embankment Performance During Overtopping and Throughflow. Report 1: Feasibility Study.
W91-02603 8A

Study of Embankment Performance During Overtopping and Throughflow. Report 2: Hydraulic Study and Modeling of Models.
W91-02608 8B

Study of Embankment Performance During Overtopping and Throughflow. Report 3: Model-Prototype Comparison Studies.
W91-02610 8B

OXIDATION-REDUCTION POTENTIAL
New Liquid-Junction Free Probe for the In Situ Determination of pH, pH2S and Redox Values.
W91-02788 7B

OXYGEN ISOTOPES
Tritium, Oxygen-18, and Deuterium Diffusion at the Confederation Road Landfill Site, Sarnia, Ontario, Canada.
W91-02146 5B

Use of Oxygen-18 and Deuterium Mass-Balance Analysis to Evaluate Induced Recharge to Stratified-Drift Aquifers.
W91-02287 2F

Sulphur and Oxygen Isotopes of Dissolved Sulphur Species in Formation Waters from the Dogger Geothermal Aquifer, Paris Basin, France.
W91-02890 2K

OXYGEN UPTAKE
Oxygen Uptake of Pseudosuccinea columella and Fossaria cubensis Treated with Sublethal Concentrations of CUTRINE-PLUS, an Algicide.
W91-02096 5C

OYSTERS
Sublethal and Histopathological Effects of Trace Levels of Tributyltin Fluoride on Adult Oysters Crassostrea gigas.
W91-02045 5C

Effects of Environmental Parameters on the Elimination of Cadmium by Eastern Oysters, Crassostrea virginica.
W91-02198 5B

OZONATION
Wastewater Treatment: Ozonation Processes and Equipment (Jan 77-Apr 90). Citations from the Selected Water Resources Abstracts Database.
W91-02667 5D

Ozonation of o-Cresol in Aqueous Solutions.
W91-02783 5D

Evolution of an Ozone Process at Littleton Water-Treatment Works.
W91-02849 5F

OZONE
Evolution of an Ozone Process at Littleton Water-Treatment Works.
W91-02849 5F

PACKED BEDS
Electrolytic Decomposition of Cyanide Effluent with an Electrochemical Reactor Packed with Stainless Steel Fiber.
W91-02784 5D

PAKISTAN
Hydrocarbon Concentrations in Sediments and Animal Tissues from the Coastal Waters of Karachi.
W91-02558 5B

PALEOHYDROLOGY
Fan-Delta and Braid-Delta Systems in Pennsylvanian Sandia Formation, Taos Trough, Northern New Mexico: Depositional and Tectonic Implications.
W91-02519 2J

PALM TREES
Palm Communities in Wetland Forest Ecosystems of Peruvian Amazonia.

W91-02552 5C

PESTICIDES

Toxicity Test for Water and Waste Water: Aldehyde Dehydrogenase Inhibition Test in Cuvets and Microtiter Plates (Toxizitaetstests fuer Wasser und Abwasser: Kuevetten- und Mikrotiterplattentest mit Aldehyddehydrogenase).
W91-02056 5A

Response and Recovery of Brain Acetylcholinesterase Activity in Atlantic Salmon (Salmo salar) Exposed to Fenitrothion.
W91-02061 5A

Fate of Parathion in Ground Water in Commercial Cranberry Culture in the New Jersey Pinelands.
W91-02098 5B

Application of Two-Site/Two-Region Models for Studying Simultaneous Nonequilibrium Transport and Degradation of Pesticides.
W91-02132 5B

Persistence of Aldicarb Residues in the Sandstone Aquifer of Prince Edward Island, Canada.
W91-02160 5B

Application of QSARs to Predict Potential Aquatic Toxicities of Organochlorine Pesticides.
W91-02178 5C

Short-Term Exposure of Zooplankton to the Synthetic Pyrethroid, Fenvalerate, and Its Effects on Rates of Filtration and Assimilation of the Alga, Chlamydomonas reinhardii.
W91-02195 5C

Detection of Organophosphorus Pesticide Detoxifying Bacterial Colonies, Using UV-Photography of Parathion-Impregnated Filters.
W91-02200 5B

Effects of Atrazine on Freshwater Microbial Communities.
W91-02202 5C

Responses of Zooplankton and Chaoborus to Temephos in a Natural Pond and in the Laboratory.
W91-02203 5C

Agricultural Pesticides and Groundwater in North Carolina: Identification of the Most Vulnerable Areas.
W91-02245 5G

Environmental Epidemiology of Non-Hodgkin's Lymphoma in Eastern Nebraska.
W91-02507 5C

Binding of Triazine Herbicides to Antibodies in Anhydrous Organic Solvents.
W91-02512 5A

S-Oxygenation of Thiobencarb (Bolero) in Hepatic Preparations from Striped Bass (Morone saxatilis) and Mammalian systems.
W91-02552 5C

Loading of Water and Soil by Pollutants in Shelby County.
W91-02583 5B

Threat to Groundwater Quality by Pesticides in The Netherlands.
W91-02688 5B

Leaching of Pesticides from Treated Timbers--A Source of Pollution.
W91-02844 5B

Fate of Aldicarb in the Unsaturated Zone Beneath a Citrus Grove.
W91-02859 5B

PETROLEUM PRODUCTS

Numerical Model for Simulating the In-situ Volatilization of Hydrocarbon Contaminants in Soils.
W91-02705 5B

PHARMACEUTICAL WASTES

Decontamination Technologies for Release from Bioprocessing Facilities: Part V. Decontamination of Sludge.
W91-02936 5D

Decontamination Technologies for Release from Bioprocessing Facilities: Part VI. Verification of Wastewater Decontamination.
W91-02937 5D

PHENOLS

Sorption Layers Impregnated with Ammonium Molybdate for the Thin Layer Chromatography in Order to Evaluate Phenol Contaminated Waters (Ammoniummolybdatimpaegnierte Sorptionschichten fuer die Duennschichtchromatographie zur Beurteilung Phenolkontaminierter Waesser).
W91-02059 5A

Stabilities of Carboxylic Acids and Phenols in Los Angeles Rainwaters During Storage.
W91-02800 5A

PHILIPPINES

Identification and Inventory of Philippine Forested-Wetland Resource.
W91-02473 2H

PHOSPHATES

Phosphorus Cycle and Its Significance in the Eutrophication of Lake Sevan.
W91-02376 5C

Simple Method to Distinguish Between Polyphosphate and Other Phosphate Fractions of Activated Sludge.
W91-02790 5D

PHOSPHORUS

Biologically Available Phosphorus Retention by the Kis-Balaton Reservoir.
W91-02375 2H

Phosphorus Cycle and Its Significance in the Eutrophication of Lake Sevan.
W91-02376 5C

Short Term Response to Eutrophication Abatement.
W91-02447 5G

Seasonal Delivery of the Particulate Forms of Phosphorus to Lake Geneva from the Upper Rhone River.
W91-02448 2H

Type of Suspended Clay Influences Lake Productivity and Phytoplankton Community Response to Phosphorus Loading.
W91-02586 2H

Integrated Approach to Quantify Groundwater Transport of Phosphorus to Narrow Lake, Alberta.
W91-02589 2F

PHOSPHORUS REMOVAL

Effects of Chemical Phosphorus Precipitation on Anaerobic Digestion.
W91-02823 5D

PHOTOCHEMISTRY

Determination of Photochemically Produced Hydroxyl Radicals in Seawater and Freshwater.
W91-02852 5A

PHOTOGRAMMETRY

PC-Based Analytical Stereoplotter for Wetland Inventories: An Efficient and Economical Photogrammetric Instrument for Field Offices.
W91-02503 7B

PHOTOLYSIS

Photocatalytic Degradation of Organophosphorous Insecticides in Aqueous Semiconductor Suspensions.
W91-02799 5D

PHYTOPLANKTON

Soluble Fluorescence: Effects on Chlorophyll Determination at Different Salinities.
W91-02065 2L

Modelling Phytoplankton Productivity in Turbid Waters with Small Euphotic to Mixing Depth Ratios.
W91-02115 2H

Changes in Seasonal Succession of Phytoplankton Induced by the Storm-Surge Barrier in the Oosterschelde (S.W. Netherlands).
W91-02116 2L

Limnology and Eutrophication of Barra Bonita Reservoir, S. Paulo State, Southern Brazil.
W91-02371 2H

Longitudinal Differentiation According to Environmental Factors and Phytoplankton in Aracena and La Minilla Reservoirs (Sevilla, Spain).
W91-02379 2H

Long-term Relationships Between Phyto- and Zooplankton in the Meso-Eutrophic Reservoir Saidenbach.
W91-02380 2H

Ecology of Lowland Zegrzynski Reservoir near Warsaw.
W91-02389 2H

Influence of Impoundments on Phytoseston Biomass of Two Small Lowland Rivers-Skierniewka and Rawka in 1983.
W91-02390 2H

Key Factors in Taste and Odour Problems for Municipal Water Works Using Surface Water Sources.
W91-02394 5F

Relating Empirical Water Quality Diagrams and Plankton-Dynamical Models: The SAMPLE Methodology Applied to a Drinking Water Storage Reservoir.
W91-02395 5F

Annual Cycles of Plankton Species Composition and Physical Chemical Conditions in Slapy Reservoir Detected by Multivariate Statistics.
W91-02398 2H

Relationship of Reservoir Biogeochemical Processes to the Structural Integrity of the World's First Totally Roller Compacted Concrete Dam.
W91-02399 8F

Planktoneustonic Algae in the Surface Films of Lake Zurich: Occurrence and Dependence on Phytoplankton Succession.
W91-02451 2H

Response of the Microbial Loop to Phytoplankton Spring Bloom in a Large Prealpine Lake.
W91-02584 2H

Type of Suspended Clay Influences Lake Productivity and Phytoplankton Community Response to Phosphorus Loading.
W91-02586 2H

Study on the Hydrology and Phytoplankton of the Varano Lake (Adriatic Sea) During an Annual Cycle (May 1985-April 1986). (Etude sur Lac de Varano (Mer Adriatique): Mai 1985-Avril 1986).
W91-02934 2L

PIEZOCONE PENETRATION

Observations on the Development of Pore-Water Stresses During Piezocone Penetration in Clays.
W91-02938 7B

PIEZOMETERS

Observations on the Development of Pore-Water Stresses During Piezocone Penetration in Clays.
W91-02938 7B

PIEZOMETRIC HEAD

Analysis of the In situ Constant-Head Permeability Test in Clays.
W91-02148 7B

Study of Piezometric Depressions by Environmental Isotopes: First Data on Examples in Mali (Etude des Depressions Piezometriques par les Isotopes de l'Environnement: Premieres Donnees sur des Exemples au Mali).
W91-02343 2F

PINE TREES

Possible Effects of Residential Development on Streamflow, Riparian Plant Communities, and Fisheries on Small Mountain Streams in Central Arizona.
W91-02493 4C

PIPE FLOW

Effects of Flow Disturbances on the Accuracy of Turbine-Type Water Meters.
W91-02143 7B

Energy Relations in Transient Closed-Conduit Flow.
W91-02522 8B

Split of Two-Phase Flow at a Horizontal T-Annular and Stratified Flow.
W91-02613 8B

Explicit Calculation of Pipe-Network Parameters.
W91-02917 8B

PIPELINES
Energy Relations in Transient Closed-Conduit Flow.
W91-02522 8B

PIPES
Sliplining Rescues Sewers and a Small Budget.
W91-02424 8A

Explicit Calculation of Pipe-Network Parameters.
W91-02917 8B

PLANKTON
Micrograzer Impact and Substrate Limitation of Bacterioplankton in Lake Michigan.
W91-02072 2H

Classification of Some Reservoirs in SR Serbia (SFR Yugoslavia) Based on Analysis of Plankton Species as Indicators of Trophic Conditions.
W91-02388 2H

Planktonic Community Structure Determines the Fate of Bacterial Production in a Temperate Lake.
W91-02585 2H

PLANNING
Application of the Analytic Element Method for National Groundwater Management in The Netherlands.
W91-02697 6A

Aquifers as Components of Water Resources Systems.
W91-02709 4B

Regionalization Schemes for the Management of Large Water Resources Systems.
W91-02711 4B

Role of Groundwater in Israel's Integrated Water System.
W91-02714 4B

PLANT GROWTH
Influence of Plant Water Stress on Net Photosynthesis and Leaf Area of Two Maize (Zea mays L.) Cultivars.
W91-02075 3F

Soil and Vegetation Responses to Sewage Sludge on a Degraded Semiarid Broom Snakeweed/Blue Grama Plant Community.
W91-02076 5E

Influence of the Herbicide Paraquat 'Gramaxon' on Growth and Metabolic Activity of Three Chlorophytes.
W91-02085 4A

Growth, Production, and Decomposition Dynamics of Sphagnum Under Natural and Experimentally Acidified Conditions.
W91-02404 5C

PLANT POPULATIONS
Woody Plant Succession on Earthquake-Uplifted Coastal Wetlands of the Copper River Delta, Alaska.
W91-02498 2H

PLANT WATER POTENTIAL
Influence of Plant Water Stress on Net Photosynthesis and Leaf Area of Two Maize (Zea mays L.) Cultivars.
W91-02075 3F

Rapid Evaluation of Salt Tolerance of Mangrove-Swamp Rice Varieties.
W91-02077 3C

PLEISTOCENE AQUIFERS
Model to Predict and Assess the Effects of Groundwater Withdrawal on the Vegetation in the Pleistocene Areas of The Netherlands.
W91-02949 6G

PLUMES
Estimating Groundwater Exchange with Lakes: 2. Calibration of a Three-Dimensional, Solute Transport Model to a Stable Isotope Plume.
W91-02874 2F

Application of the Arnoldi Algorithm to the Solution of the Advection-Dispersion Equation.
W91-02883 5B

POINT DISCHARGE CURRENT
Some Characteristics of Point Discharge Current during Two Pre-Monsoon Season Thunderstorms at Pune.
W91-02553 2B

POLITICAL ASPECTS
Systems Engineering Approach to Solutions of Drought in Developing Countries: The Case of Tanzania.
W91-02361 2A

Design and Management of Rural Water Supply Projects: Lessons Learned from Comparative Study of USAID Projects in Burkina Faso and Togo.
W91-02362 5F

POLLUTANT IDENTIFICATION
Total Heavy Metal Concentrations Contained on the Sediment's Surface of Algiers Bay.
W91-02053 5B

Coastal Water Pollution: Dissolved Heavy Metals and Suspended Particulate Matter.
W91-02057 5A

Sorption Layers Impregnated with Ammonium Molybdate for the Thin Layer Chromatography in Order to Evaluate Phenol Contaminated Waters (Ammoniummolybdatimpaegnierte Sorptionschichten fuer die Duennschichtchromatographie zur Beurteilung Phenolkontaminierter Waesser).
W91-02059 5A

Preconcentration of Copper on Algae and Determination by Slurry Graphite Furnace Atomic Absorption Spectrometry.
W91-02191 5A

Enzyme-Linked Immunosorbent Assay Compared with Gas Chromatography/Mass Spectrometry for the Determination of Triazine Herbicides in Water.
W91-02192 5A

Rainbow Trout Liver Activation Systems with the Ames Mutagenicity Test.
W91-02217 5A

Comparison of Quarter-Hourly On-Line Dynamic Headspace Analysis to Purge-and-Trap Analysis of Varying Volatile Organic Compounds in Drinking Water Sources.
W91-02219 5A

Simple Membrane Filter Method to Concentrate and Enumerate Male-Specific RNA Coliphages.
W91-02416 5A

Liquid Chromatography-Mass Spectrometry: An Emerging Technology for Nonvolatile Compounds.
W91-02417 5A

Comparison of the Zinc Sulfate and Immunofluorescence Techniques for Detecting Giardia and Cryptosporidium.
W91-02419 5A

Assessing Defined-Substrate Technology for Meeting Monitoring Requirements of the Total Coliform Rule.
W91-02420 5A

Binding of Triazine Herbicides to Antibodies in Anhydrous Organic Solvents.
W91-02512 5A

Determination of Cobalt by Adsorptive Stripping Voltammetry Using Cobalt(II)-Nioxime-Nitrite Catalytic System.
W91-02513 5A

Safety and Efficacy of Food Processing Sludges as Animal Feed: Chemical Characterization.
W91-02542 5E

Analytical Properties of 4,4'-Biazobenzenediazoaminobenzene and Its Applications in Spectrophotometry.
W91-02548 5A

Determination of Trace Amounts of Acetaldehyde Using a Novel Chemiluminescence Reaction.
W91-02549 7B

Structure of an Anhydride Related to a Mutagenic Component of Drinking Water, 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone.
W91-02551 5A

Analytical Approach to Assessment of Long-Term Effects of Low Levels of Contaminants in the Marine Environment.
W91-02554 5A

Application of a Simple Short-Term Bioassay for the Identification of Genotoxins from Hazardous Wastes.
W91-02665 5A

Adaptation of a Lead-testing Program.
W91-02765 5A

Application of Direct Plaque Assay for Detection and Enumeration of Bacteriophages of Bacteroides fragilis from Contaminated-Water Samples.
W91-02770 5A

Stabilities of Carboxylic Acids and Phenols in Los Angeles Rainwaters During Storage.
W91-02800 5A

Determination of Photochemically Produced Hydroxyl Radicals in Seawater and Freshwater.
W91-02852 5A

Hydrocarbon Pollution in Particle-Rich Waters (Gulf of Fos-sur-mer): Comparative Study of Extraction Procedures.
W91-02854 5A

POLLUTANT LOAD
Loading of Water and Soil by Pollutants in Shelby County.
W91-02583 5B

POLLUTANT TRANSPORT
Numerical Model for Simulating the In-situ Volatilization of Hydrocarbon Contaminants in Soils.
W91-02705 5B

Modelling of Flow and Contaminant Transport in a Conjunctively Managed Groundwater Basin: A Case Study.
W91-02707 5B

POLLUTANTS
Application of the Arnoldi Algorithm to the Solution of the Advection-Dispersion Equation.
W91-02883 5B

POLLUTION INDEX
Water Quality of Some Reservoirs.
W91-02391 5A

Revision of the Saprobic System (Eine Revision des Saprobiensystems).
W91-02546 5G

POLYCHLORINATED BIPHENYLS
Residue Levels of Organochlorine Chemicals and Polychlorinated Biphenyls in Fish from the Alexandria Region, Egypt.
W91-02197 5B

Microcontaminants and Reproductive Impairment of the Forster's Tern on Green Bay, Lake Michigan-1983.
W91-02441 5C

Long-Term Monitoring of Polychlorinated Biphenyls in the Hudson River (New York) Using Caddisfly Larvae and Other Macroinvertebrates.
W91-02464 5B

Polychlorinated Biphenyl Congeners in Sediments, Plankton, Molluscs, Crustaceans, and Eel in a Freshwater Lake: Implications of Using Reference Chemicals and Indicator Organisms in Bioaccumulation Studies.
W91-02465 5B

Chronic Effects of 2,2'-dichlorobiphenyl on Reproduction, Mortality, Growth, and Respiration of Daphnia pulicaria.
W91-02466 5C

Spatial Differences and Temporal Trends of Organochlorine Compounds in Biota from the Northwestern Hemisphere.
W91-02467 5B

Polychlorinated Biphenyls Partitioning in Waters from River, Filtration Plant and Wastewater Plant: The Case for Paris (France).
W91-02786 5B

POLYCYCLIC AROMATIC HYDROCARBONS
Source, Composition and Flux of Polycyclic Aromatic Hydrocarbons in Sediments of the River Derwent, Derbyshire, U.K.
W91-02079 5B

PAH and Organic Content of Sediment Particle Size Fractions.
W91-02080 5B

POLYMERS
Effect of Charge Density and Molecular Mass of Cationic Polymers on Flocculation Kinetics in Aqueous Solution.
W91-02145 5F

POLYPHOSPHATE
Simple Method to Distinguish Between Polyphosphate and Other Phosphate Fractions of Activated Sludge.
W91-02790 5D

PONDS
MESIP: Modelling Environmental Scenarios in Ponds.
W91-02176 7C

Responses of Zooplankton and Chaoborus to Temephos in a Natural Pond and in the Laboratory.
W91-02203 5C

POPULATION DENSITY
Spatial Organization and Population Density of the Fish Community of the Litter Banks within a Central Amazonian Blackwater Stream.
W91-02414 2H

Sampling Intensity and Species Richness: Effects on Delineating Southwestern Riparian Plant Communities.
W91-02492 2H

POPULATION DYNAMICS
Changes in Seasonal Succession of Phytoplankton Induced by the Storm-Surge Barrier in the Oosterschelde (S.W. Netherlands).
W91-02116 2L

Long-term Relationships Between Phyto- and Zooplankton in the Meso-Eutrophic Reservoir Saidenbach.
W91-02380 2H

Annual Cycles of Plankton Species Composition and Physical Chemical Conditions in Slapy Reservoir Detected by Multivariate Statistics.
W91-02398 2H

Foodweb Response to the Experimental Manipulation of a Benthivore (Cyprinus carpio), Zooplanktivore (Menidia beryllina) and Benthic Insects.
W91-02453 2H

Assemblage Stability in Stream Fishes: A Review.
W91-02904 2H

POPULATION EXPOSURE
Effects of Water Acidity, Calcium, and Aluminum on Whole Body Ions of Brook Trout (Salvelinus fontinalis) Continuously Exposed from Fertilization to Swim-Up: A Study by Instrumental Neutron Activation Analysis.
W91-02104 5C

Epidermal Response to pH, Aluminum, and Calcium Exposure in Brook Trout (Salvelinus fontinalis) Fry.
W91-02106 5C

Responses of Brook Trout (Salvelinus fontinalis) Fry to Fluctuating Acid, Aluminum, and Low Calcium Exposure.
W91-02107 5C

EXAMS 2: Exposure Analysis Modeling System.
W91-02174 7B

Microcontaminants and Reproductive Impairment of the Forster's Tern on Green Bay, Lake Michigan-1983.
W91-02441 5C

Environmental Epidemiology of Non-Hodgkin's Lymphoma in Eastern Nebraska.
W91-02507 5C

Drinking Water Contamination and the Incidence of Leukemia: An Ecologic Study.
W91-02509 5C

Leukemia Incidence and Radioactivity in Drinking Water in 59 Iowa Towns.
W91-02511 5C

PORE PRESSURE
Pore Pressure Field Built Up in a Rapidly Eroded Soil Mass.
W91-02149 8D

PORE SIZE
Pore Size, Particle Size, Aggregate Size, and Water Retention.
W91-02131 2G

PORE WATER
Observations on the Development of Pore-Water Stresses During Piezocone Penetration in Clays.
W91-02938 7B

POROSITY
Macroporosity and Its Relation to Saturated Hydraulic Conductivity under Different Tillage Practices.
W91-02138 2G

POROUS MEDIA
Stimulation of Biologically Active Zones (BAZ's) in Porous Media by Electron-Acceptor Injection.
W91-02161 5G

Analytical Solution for One-Dimensional Transport in Heterogeneous Porous Media.
W91-02863 5F

Numerical Simulation of Solute Transport in Three-Dimensional, Randomly Heterogeneous Porous Media.
W91-02881 5B

PORT OF ALGIERS
Macrobenthic Population of the Port of Algiers (Les Peuplements Macro Benthiques du Port d'Alger).
W91-02054 5B

POTABLE WATER
Leigh Creek Town Water Supply--A History.
W91-02528 5F

Technologies and Costs for the Treatment of Microbial Contaminants in Potable Water Supplies.
W91-02614 5F

Alluvial Aquifer of the Grand Gravier (Rhone Valley, France) Modelling and Protection.
W91-02721 5G

Cost Supplement to Technologies and Costs for the Removal of Mercury from Potable Water Supplies.
W91-02725 5F

Cost Supplement to Technologies and Costs for the Removal of Nitrates and Nitrites from Potable Water Supplies.
W91-02726 5F

Cost Supplement to Technologies and Costs for the Removal of Chromium from Potable Water Supplies.
W91-02727 5F

Cost Supplement to Technologies and Costs for the Removal of Selenium from Potable Water Supplies.
W91-02728 5F

Cost Supplement to Removal of Cadmium from Potable Water Supplies.
W91-02729 5F

Cost Supplement to Technologies and Costs for the Removal of Asbestos from Potable Water Supplies.
W91-02730 5F

Outbreak of Campylobacter Enteritis Associated with a Community Water Supply.
W91-02781 5C

POTENTIOMETRIC LEVEL
Altitude of Potentiometric Surface, Fall 1985, and Historic Water-Level Changes in the Memphis Aquifer in Western Tennessee.
W91-02224 2F

Altitude of Potentiometric Surface, Fall 1985, and Historic Water-Level Changes in the Fort Pillow Aquifer in Western Tennessee.
W91-02248 2F

Difference Between the Potentiometric Surface of the Aquia Aquifer of September 1986 and September 1988 in Southern Maryland.
W91-02255 7C

Difference Between the Potentiometric Surface of the Magothy Aquifer of September 1986 and September 1988 in Southern Maryland.
W91-02256 7C

Potentiometric Surface of the Aquia Aquifer in Southern Maryland During September 1988.
W91-02257 7C

POTOMAC RIVER
Two Decades of Progress.
W91-02957 5G

POWDER RIVER BASIN
Geochemistry of Batch-Extract Waters Derived from Spoil Material Collected at the Cordero Coal Mine, Powder River Basin, Wyoming.
W91-02222 5B

PRAIRIES
Patterns and Controls of Nitrogen in Tallgrass Prairie Streams.
W91-02405 2H

PRECIPITATION
Drought in France in 1989 (La Secheresse de 1989).
W91-02048 2B

Physics of Supercooling of Thin Water Skins Covering Gyrating Hailstones.
W91-02119 2C

Parameterization of the Accretion Process between Different Precipitation Elements.
W91-02120 2B

Foundation Problems in Champlain Clays During Droughts. I: Rainfall Deficits in Montreal (1930-1988).
W91-02147 8D

Similarity and Length Scale for Spatially Varied Overland Flow.
W91-02189 2E

Precipitation Fluctuation over Semiarid Regions in Northern China and the Relationship with El Nino/Southern Oscillation.
W91-02446 2B

Precipitation, Throughfall, Soil Solution and Streamwater Chemistry in a Holm-Oak (Quercus ilex) Forest.
W91-02744 2K

Stabilities of Carboxylic Acids and Phenols in Los Angeles Rainwaters During Storage.
W91-02800 5A

Liquid Water Content and Precipitation Characteristics of Stratiform Clouds as Inferred from Satellite Microwave Measurements.
W91-02835 2B

Periodic-Stochastic Modeling of Separation of Precipitation into Rainfall and Snowfall.
W91-02886 2B

PRECIPITATION EXCESS
Hydrological Aspects of the Development and Rapid Decay of the 1989 Drought.
W91-02428 2B

PRECIPITATION MAPPING
Geographic Distribution and Climatic Variation of the Pluvial Regimes in Baja California Sur, Mexico (Distribucion Geografica y Variabilidad Climatica de los Regimenes Pluviometricos en Baja California Sur, Mexico).
W91-02805 2B

PRECONCENTRATION
Preconcentration of Copper on Algae and Determination by Slurry Graphite Furnace Atomic Absorption Spectrometry.
W91-02191 5A

PREDATION
Reciprocal Diel Vertical Migration Behavior in Planktivores and Zooplankton in British Columbia Lakes.
W91-02067 2H

Predation on Amphibian Eggs and Tadpoles by Common Predators in Acidified Lakes.
W91-02407 5C

PREDICTION
Improved Methods for Regional Flood Frequency Analysis.
W91-02243 2E

Predicting Runoff from Rangeland Catchments: A Comparison of Two Models.
W91-02869 2E

PREMATURE THELARCHE
Premature Thelarche in Puerto Rico: A Search for Environmental Estrogenic Contamination.
W91-02429 5C

PRESERVATIVES
Leaching of Pesticides from Treated Timbers--A Source of Pollution.
W91-02844 5B

PRICING
Pretest Analyses of Water Demand in Thirty Communities.
W91-02855 6D

PRIMARY PRODUCTIVITY
Growth, Production, and Decomposition Dynamics of Sphagnum Under Natural and Experimentally Acidified Conditions.
W91-02404 5C

Planktonic Community Structure Determines the Fate of Bacterial Production in a Temperate Lake.
W91-02585 2H

Dependence of Estuarine Productivity on Anomalies in Mean Sea Level.
W91-02590 2L

PRINCE EDWARD ISLAND
Persistence of Aldicarb Residues in the Sandstone Aquifer of Prince Edward Island, Canada.
W91-02160 5B

PRIORITY POLLUTANTS
Safety and Efficacy of Food Processing Sludges as Animal Feed: Chemical Characterization.
W91-02542 5E

PROBABILITY DISTRIBUTION
Probability Model for Acid Rain Data.
W91-02787 5B

PROCESS CONTROL
Computer-Controlled Well Field and Distribution System.
W91-02427 5F

Using Programmable Logic Controllers.
W91-02566 5D

Testing Expert System for Activated Sludge Process Control.
W91-02573 5D

PRODUCTIVITY
Measuring Epilithic Bacterial Production in Streams.
W91-02070 2H

PROGRAMMABLE LOGIC CONTROLLERS
Using Programmable Logic Controllers.
W91-02566 5D

PROJECT PLANNING
Institutional Economics and Indian Water Projects-Does the Framework Make a Difference.
W91-02268 6A

From Zero to 20 MGD in Ten Months.
W91-02422 5F

Guidelines for Developing a Project.
W91-02567 6B

Economic Benefit Considerations in Selecting Water Quality Projects. Insights from the Rural Clean Water Program.
W91-02622 5G

PROJECTS
Water Resources Activities in Florida, 1989-90.
W91-02258 7C

PROPIONATE
Interaction between Sulfate Reducers and Methanogens Fed Acetate and Propionate.
W91-02537 5D

PROTEINS
Periphyton Ash Weight Estimation from Residue Not Digested after Hach Method of Kjeldahl Protein Nitrogen Analysis.
W91-02785 7B

PROTOZOA
Comparison of the Zinc Sulfate and Immunofluorescence Techniques for Detecting Giardia and Cryptosporidium.
W91-02419 5A

PRUDHOE BAY
Weathered Crude Oil Effects on Chicks of Fork-Tailed Storm-Petrels (Oceanodroma furcata).
W91-02207 5C

PUBLIC HEALTH
Guidelines and Integrated Measures for Public Health Protection in Agricultural Reuse Systems.
W91-02142 5E

Impacts of Urban Waste on Surface Water in Ouagadougou and Bobo-Dioulasso (Burkina Faso) (Impacts des Rejets Urbains sur les Eaux de Surface a Ouagadougou et Bob-Dioulasso (Burkina Faso)).

Health Effects of Chemical Waste in an Urban Community.
W91-02952 5C

PUBLIC OPINION
Siting and Technology Pose Challenges for Communities Ending Ocean Disposal of Sludge.
W91-02955 5D

PUBLIC PARTICIPATION
Volunteer Lake Monitoring Program, 1988. Volume V1: Southwestern Illinois Region.
W91-02618 7B

PUBLIC POLICY
Systems Engineering Approach to Solutions of Drought in Developing Countries: The Case of Tanzania.
W91-02361 2A

Design and Management of Rural Water Supply Projects: Lessons Learned from Comparative Study of USAID Projects in Burkina Faso and Togo.
W91-02362 5F

PUBLICATIONS
Willie Takes a Field Trip Coloring Book.
W91-02251 9A

Water Resources Activities in Florida, 1989-90.
W91-02258 7C

PUERTO RICO
Effect of Sewage Sludge on Nutrient and Toxic Metal Content of Soil and Selected Crops Grown on Tropical Soils.
W91-02239 5C

Premature Thelarche in Puerto Rico: A Search for Environmental Estrogenic Contamination.
W91-02429 5C

Persistence of Spilled Crude Oil in a Tropical Intertidal Environment.
W91-02556 5B

Water Resources Data for Puerto Rico and the U.S. Virgin Islands, Water Year 1989.
W91-02636 7C

PUGET SOUND
Annual Mean Transport in Puget Sound.
W91-02615 5B

PULP AND PAPER INDUSTRY
Pulping Effluents: Biological Treatment (Jan 76 - Sep 89). Citations from the Paper & Board, Printing & Packaging Industries Research Association.
W91-02645 5D

Role of Resin Acids in the Anaerobic Toxicity of Chemithermomechanical Pulp Wastewater.
W91-02797 5D

PULP WASTES
Histopathology of Rainbow Trout Exposed to a Bleached Kraft Pulp Mill Effluent.
W91-02459 5C

Effects of Pulp Mill Effluents on Vertebrae of Fourhorn Sculpin, Myoxocephalus quadricornis, Bleak, Alburnus alburnus, and Perch, Perca fluviatilis.
W91-02468 5C

Continuous Anaerobic Treatment of Pulping Wastewaters.
W91-02580 5D

Pulping Effluents: Biological Treatment (Jan 76 - Sep 89). Citations from the Paper & Board, Printing & Packaging Industries Research Association.
W91-02645 5D

Role of Resin Acids in the Anaerobic Toxicity of Chemithermomechanical Pulp Wastewater.
W91-02797 5D

PUMPING
Computer-Controlled Well Field and Distribution System.
W91-02427 5F

PUMPING PLANTS
Yazoo Backwater Pumping Station Sump, West-Central Mississippi: Hydraulic Model Investigation.
W91-02606 8B

PUMPS
Impact of Handpump Corrosion on Water Quality.
W91-02338 5F

PULSA SOLAR: Solar Water Oscillation Pumps for Village Hydraulics.
W91-02347 5F

PYROLYSIS
Pyrolysis-GC-MS for Investigating High-Molecular-Weight THM Precursors and Other Refractory Organics.
W91-02418 5F

PYRUVIC ACID
Sources and Sinks of Formic, Acetic, and Pyruvic Acids Over Central Amazonia. 2. Wet Season.
W91-02838 5B

QUARRIES
Analysis of Hydrologic Impact of Quarrying System by 3-D Finite Element Model.
W91-02921 4C

QUEBEC
Importance of Geographical Aspects in Environmental Studies of Hydro-Quebec Reservoirs.
W91-02396 2H

RADAR
Range Profiling of the Rain Rate by an Airborne Weather Radar.
W91-02128 2B

Doppler-Radar Analysis of a Low-Precipitation Severe Storm.
W91-02760 2B

RADIOACTIVE DATING
Effects of Iron Cycling on Pb-210 Dating of Sediments in an Adirondack Lake, USA.
W91-02071 2J

RADIOACTIVE TRACERS
Production of Dissolved DNA, RNA, and Protein by Microbial Populations in a Florida Reservoir.
W91-02766 2H

RADIOACTIVE WASTE DISPOSAL
Hydrogeochemical Processes Controlling the Transport of Dissolved Organic Carbon Through a Forested Hillslope.
W91-02159 5B

Modeling the Mass-Transfer Rate of Radioactive Cobalt from a Synthetic Groundwater to Volcanic Tuff Media.
W91-02163 5B

Adsorptive Solute Transport in Fractured Rock: Analytical Solutions for Delta-Type Source Conditions.
W91-02164 5B

Estimation of Flow through and over Armored Slopes.
W91-02526 5E

Gas Migration in Discrete Fracture Networks.
W91-02871 5E

RADIOACTIVE WASTES
Accumulation from Water and Depuration of 110mAg by a Freshwater Fish, Salmo trutta L.
W91-02798 5B

Gamma Emitters in Hong Kong Water.
W91-02816 5B

RADIOACTIVITY
Glacial Mass Balance Determination in the Accumulation Zone by In situ Measurements of Tchernobyl Radioactivity (Determination du Bilan Glaciaire en Zone d'Accumulation par Mesure In Situ de la Radioactivite due a Tchernobyl).
W91-02052 2C

RADIOISOTOPES
Saturated Hydraulic Conductivity of Clayey Tills and the Role of Fractures.
W91-02168 2F

Water-Quality, Well Construction, and Groundwater Level Data for an Investigation of Radionuclides in Ground Water, Hickman and Maury Counties, Tennessee.
W91-02238 2F

Effect of Uranium Mine Tailings on Radionuclide Concentrations in Langley Bay, Saskatchewan, Canada.
W91-02460 5B

RADIUM RADIOISOTOPES
Leukemia Incidence and Radioactivity in Drinking Water in 59 Iowa Towns.
W91-02511 5C

RADON
Water-Quality, Well Construction, and Groundwater Level Data for an Investigation of Radionuclides in Ground Water, Hickman and Maury Counties, Tennessee.
W91-02238 2F

Prospecting for Aquifer Fractures in the Crystalline Basement by Soil Radon Analysis (Prospection des Fractures Aquiferes du Socle Cristallin par Dosage du Gaz Radon Contenu dans le Sol).
W91-02324 2F

RAIN
Range Profiling of the Rain Rate by an Airborne Weather Radar.
W91-02128 2B

RAIN FORESTS
Ecology of Water-Filled Treeholes in Australian Rainforests: Food Web Reassembly as a Measure of Community Recovery after Disturbance.
W91-02514 2H

RAIN GAGES
Computer-Controlled Automated Rain Sampler (CCARS) for Rainfall Measurement and Sequential Sampling.
W91-02914 7B

RAINFALL
Foundation Problems in Champlain Clays During Droughts. I: Rainfall Deficits in Montreal (1930-1988).
W91-02147 8D

Floods of February 1989 in Tennessee.
W91-02260 4A

Water Assessment of Soils and Traditional Agricultural Calendars in Upper Borgou (Rep. Pop. du Benin) (Bilans d'Eau des Sols et Calendriers Agricoles Traditionnels dans le Haut Borgou (R.P. Benin)).
W91-02367 3F

Precipitation Fluctuation over Semiarid Regions in Northern China and the Relationship with El Nino/Southern Oscillation.
W91-02446 2B

Frequency-Related Temporally and Spatially Varied Rainfall.
W91-02524 2B

Rainfall and Surface Kinematic Conditions Over Central Amazonia During ABLE 2B.
W91-02841 2B

Estimates of Daily Rainfall Over the Amazon Basin.
W91-02842 2B

Climatic Influences on Streamflow Variability: A Comparison Between Southeastern Australia and Southeastern United States of America.
W91-02877 2B

Periodic-Stochastic Modeling of Separation of Precipitation into Rainfall and Snowfall.
W91-02886 2B

RAINFALL DISTRIBUTION
Similarity and Length Scale for Spatially Varied Overland Flow.
W91-02189 2E

Fractal Approach to Spatial Variability of West African Rainfall Events (Approche Fractale de la Variabilite Spatiale des Episodes Pluvieux de l'Afrique de l'Ouest).
W91-02301 2B

Analysis of Non-Stationarity of West African Rainfall and Hydrological Series (Analyse de la Non Stationnarite des Series Pluviometriques et Hydrologiques d'Afrique de l'Ouest).
W91-02302 2B

Utilization of the Law of Gaps for the Description of the Pluviometric Regime (L'Utilisation de la Loi des Fuites pour la Description des Regimes Pluviometriques).
W91-02345 2B

Frequency-Related Temporally and Spatially Varied Rainfall.
W91-02524 2B

AINFALL IMPACT
Water-Drop Kinetic Energy Effect on Infiltration in Sodium-Calcium-Magnesium Soils.
W91-02135 2G

Water Droplet Energy and Soil Amendments: Effect on Infiltration and Erosion.
W91-02136 2G

Polymer Effects on Erosion under Laboratory Rainfall Simulator Conditions.
W91-02137 2J

AINFALL INDEX
Drought in France in 1989 (La Secheresse de 1989).
W91-02048 2B

AINFALL INFILTRATION
Water-Drop Kinetic Energy Effect on Infiltration in Sodium-Calcium-Magnesium Soils.
W91-02135 2G

Water Droplet Energy and Soil Amendments: Effect on Infiltration and Erosion.
W91-02136 2G

Polymer Effects on Erosion under Laboratory Rainfall Simulator Conditions.
W91-02137 2J

AINFALL INTENSITY
Stream Sediment Loading and Rainfall--A Look at the Issue.
W91-02086 2B

Similarity and Length Scale for Spatially Varied Overland Flow.
W91-02189 2E

RAINFALL-RUNOFF RELATIONSHIPS
Similarity and Length Scale for Spatially Varied Overland Flow.
W91-02189 2E

Development of Theoretical Hydrology in West Africa (Developpement de l'Hydrologie Theorique en Afrique de l'Ouest).
W91-02289 2A

General Characteristics of Surface Hydrology in Arid and Semi-arid Areas of Africa and Their Consequences for Development (Caracteres Generaux de l'Hydrologie Superficielle des Zones Arides et Semi-Arides en Afrique: Leurs Consequences sur les Etudes des Ingenieurs).
W91-02290 2E

Hydrological Modelling for Water Management in Arid and Semi-arid Areas of Africa.
W91-02291 2A

Towards a Regional Water Resource Study of Arid and Semi-arid Africa.
W91-02295 2A

Impact of Soil Surface Deterioration on Runoff Production in the Arid and Semi-arid Zones of West Africa.
W91-02296 4C

Surface Features: One of the Key Elements of Sahelian Hydrology (Les Etats de Surface: Une des Clefs de l'Hydrologie Sahelienne).
W91-02297 2A

Some Examples of Important Problems Connected to Rainfall-Runoff Modelling in Semi-Arid Zone.
W91-02308 7C

Global Modelling of the Rain-Runoff Relationship: A Tool for Evaluation of Water Resources (Modelisation Globale de la Relation Pluie Debit: des Outils au Service de l'Evaluation des Ressources en Eau).
W91-02349 2E

Scientific and Technical Evaluation of Mathematical Models in the Planning Design and Operation of Hydrosystems in Africa.
W91-02350 2E

Use of Run Off on Cultivated Fields in the Sudan-Sahelian Area: Burkina Faso, Yatenga Province, Bidi Region (Valorisation Agricole des Eaux de Ruissellement en Zone Soudano Sahelienne: Burkina Faso, Province du Yatenga, Region de Bidi).
W91-02365 3F

Frequency-Related Temporally and Spatially Varied Rainfall.
W91-02524 2B

Estimation of Flow through and over Armored Slopes.
W91-02526 5E

Element Budgets of Two Contrasting Catchments in the Black Forest (Federal Republic of Germany).
W91-02740 5B

Influence of Acid Atmospheric Inputs on Surface Water Chemistry and Mineral Fluxes in a Declining Spruce Stand Within a Small Catchment (Vosges Massif, France).
W91-02741 5B

Stormflow Hydrochemistry of a Small Welsh Upland Catchment.
W91-02748 2K

Runoff Generation in a Sandy Area--The Nizzana Sands, Western Negev, Israel.
W91-02811 2A

Hydrological Response of Soil Surfaces to Rainfall as Affected by Cover and Position of Rock Fragments in the Top Layer.
W91-02812 2J

Reliability Estimation in Modeling Watershed Runoff with Uncertainties.
W91-02858 2E

Incorporating Hillslope Effects into the Geomorphologic Instantaneous Unit Hydrograph.
W91-02868 2E

Predicting Runoff from Rangeland Catchments: A Comparison of Two Models.
W91-02869 2E

Climatic Influences on Streamflow Variability: A Comparison Between Southeastern Australia and Southeastern United States of America.
W91-02877 2B

RAWKA RIVER
Influence of Impoundments on Phytoseston Biomass of Two Small Lowland Rivers-Skierniewka and Rawka in 1983.
W91-02390 2H

RECESSION
Low Flow Estimation Based on River Recession Rate.
W91-02847 2E

RECHARGE
Natural Groundwater Recharge Estimation in (Semi-)Arid Zones: Some State-of-the-Art Observations.
W91-02318 2F

Investigation of Groundwater Recharge Mechanisms in Burkina Faso.
W91-02320 2F

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 1. Estimation of Recharge.
W91-02332 2F

Management of Groundwater-induced River Salinity due to Land Clearing in the Murray Basin, Southeastern Australia.
W91-02681 5G

Management Model for Aquifer Recharge with Non-conservative Pollutants.
W91-02698 4B

RECLAIMED WATER
Guidelines for Developing a Project.
W91-02567 6B

RECREATION
Sewage Lagoon to Splendid Lakes.
W91-02425 5G

Pathogenic Marine Vibrio Species in Selected Nova Scotian Recreational Coastal Waters.
W91-02780 5B

EC Bathing Waters Directive as Applied to Scotland.
W91-02848 5G

REELFOOT LAKE
Aquatic and Certain Wetland Vascular Vegetation of Reelfoot Lake, 1920s-1980s. III. Submersed Macrophytes.
W91-02581 2H

Aquatic and Certain Wetland Vascular Vegetation of Reelfoot Lake, 1920s-1980s. IV. Seasonally Emergent Macrophytes.
W91-02582 2H

REFLECTANCE TECHNIQUES
Computer-Controlled 36-Channel Time Domain Reflectometry System for Monitoring Soil Water Contents.
W91-02861 2G

REFORESTATION
Possibilities for Regeneration of Floodplain Forests within the Framework of the Flood-Protection Measures on the Upper Rhine, West Germany.
W91-02472 4A

REFUGIA
Role of Refugia in Recovery from Disturbances: Modern Fragmented and Disconnected River Systems.
W91-02908 2H

REGENERATION
Possibilities for Regeneration of Floodplain Forests within the Framework of the Flood-Protection Measures on the Upper Rhine, West Germany.
W91-02472 4A

REGIONAL ACID DEPOSITION MODEL
Use of Cluster Analysis to Define Periods of Similar Meteorology and Precipitation Chemistry in Eastern North America: Part I. Transport Patterns.
W91-02409 5B

REGIONAL AQUIFER SYSTEM ANALYSIS
Water-Quality Characteristics of the Columbia Plateau Regional Aquifer System in Parts of Washington, Oregon, and Idaho.
W91-02223 2F

REGIONAL AQUIFER-SYSTEMS ANALYSIS
Northeast Glacial Aquifers.
W91-02280 2F

Northeast Glacial Aquifers RASA Project--An Overview of Results through 1987.
W91-02281 2F

Upland Runoff as a Major Source of Recharge to Stratified Drift in the Glaciated Northeast.
W91-02282 2F

Estimation of Water Available for Recharge to Sand and Gravel Aquifers in the Glaciated Northeastern United States.
W91-02283 2F

Evaluation of the Continuous Seismic-Reflection Method for Determining the Thickness and Lithology of Stratified Drift in the Glaciated Northeast.
W91-02284 7B

Continuous Seismic-Reflection Profiling of Glacial Drift along the Susquehanna, Chemung, and Chenango Rivers, South-Central New York and North-Central Pennsylvania.
W91-02285 7B

Geochemistry of the Stratified-Drift Aquifer in Killbuck Creek Valley West of Wooster, Ohio.
W91-02286 2F

Use of Oxygen-18 and Deuterium Mass-Balance Analysis to Evaluate Induced Recharge to Stratified-Drift Aquifers.
W91-02287 2F

REGIONAL DEVELOPMENT
Possible Effects of Residential Development on Streamflow, Riparian Plant Communities, and Fisheries on Small Mountain Streams in Central Arizona.
W91-02493 4C

REGIONAL FLOODS
Improved Methods for Regional Flood Frequency Analysis.
W91-02243 2E

Evaluation of Regional Flood Frequency Analysis with a Region of Influence Approach.
W91-02856 2E

REGIONAL PLANNING
Missouri River Management Project: Learning to Cooperate.
W91-02264 6A

Towards a Regional Water Resource Study of Arid and Semi-arid Africa.
W91-02295 2A

Regionalization Schemes for the Management of Large Water Resources Systems.
W91-02711 4B

REGOLITHS
Turbulent Flow Theory for African Regoliths.
W91-02344 2F

REGRESSION ANALYSIS
Correlation of Erosion Measurements and Soil Caesium-137 Content.
W91-02913 2J

Gamma-Autoregressive Models for Stream-Flow Simulation.

Controls and Effects of Continental Brine Formation in a Supratidal Ephemeral Lake in the Semi-arid Environment of Spencer Gulf, South Australia.
W91-02806 2H

SALINE GROUNDWATER
Glaciation and Saline-Freshwater Mixing as a Possible Cause of Cave Formation in the Eastern Midcontinent Region of the United States: A Conceptual Model.
W91-02153 2F

Artificial Recharge in the Angas-Bremer Irrigation Area.
W91-02530 4B

Groundwater Management Strategy for Salinity Mitigation in the Victorian Riverine Plain, Australia.
W91-02713 3C

SALINE LAKES
Controls and Effects of Continental Brine Formation in a Supratidal Ephemeral Lake in the Semi-arid Environment of Spencer Gulf, South Australia.
W91-02806 2H

SALINE SOILS
Groundwater Management Strategy for Salinity Mitigation in the Victorian Riverine Plain, Australia.
W91-02713 3C

SALINE WATER
Management of Groundwater-induced River Salinity due to Land Clearing in the Murray Basin, Southeastern Australia.
W91-02681 5G

SALINE WATER INTRUSION
Flooding and Saltwater Intrusion: Potential Effects on Survival and Productivity of Wetland Forests Along the U.S. Gulf Coast.
W91-02489 4C

Comparative Study of the Response of Taxodium distichum and Nyssa aquatica Seedlings to Soil Anaerobiosis and Salinity.
W91-02500 2E

Modeling of Variable Density Flow, Application to the Management of Coastal Aquifers (Modelisation des Ecoulements a Densite Variable, Application a l'Exploitation des Aquiferes Cotiers).
W91-02706 2F

Analysis of Long-Term Salinity Patterns in the Louisiana Coastal Zone.
W91-02762 2L

Experimental Investigation of Variable Density Flow and Mixing in Homogeneous and Heterogeneous Media.
W91-02862 2F

SALINITY
Soluble Fluorescence: Effects on Chlorophyll Determination at Different Salinities.
W91-02065 2L

Rapid Evaluation of Salt Tolerance of Mangrove-Swamp Rice Varieties.
W91-02077 3C

Barium Bioaccumulation in Clams Collected from Different Salinity Regimes along the Saudi Coast of the Arabian Gulf.
W91-02094 5B

Effects of Environmental Parameters on the Elimination of Cadmium by Eastern Oysters, Crassostrea virginica.
W91-02198 5B

Comparative Study of the Response of Taxodium distichum and Nyssa aquatica Seedlings to Soil Anaerobiosis and Salinity.
W91-02500 2E

Groundwater Recharge from Lake Chad.
W91-02591 2F

Analysis of Long-Term Salinity Patterns in the Louisiana Coastal Zone.
W91-02762 2L

SALMON
Response and Recovery of Brain Acetylcholinesterase Activity in Atlantic Salmon (Salmo salar) Exposed to Fenitrothion.
W91-02061 5A

Reciprocal Diel Vertical Migration Behavior in Planktivores and Zooplankton in British Columbia Lakes.
W91-02067 2H

Changes in Plasma, Liver, and Ovary Vitellogenin in Landlocked Atlantic Salmon Following Exposure to Sublethal Cyanide.
W91-02196 5C

SALMON RIVER
Salmon and the Snake: Meeting Fish Flow Objectives in a Semi-Arid River Basin.
W91-02279 6D

SALT BALANCE
Groundwater Recharge from Lake Chad.
W91-02591 2F

SALT MARSHES
Elevated Atmospheric CO2 Effects on Belowground Processes in C3 and C4 Estuarine Marsh Communities.
W91-02406 5C

Dependence of Estuarine Productivity on Anomalies in Mean Sea Level.
W91-02590 2L

Method for the Quantitative Evaluation of Fish Movements in Salt Ponds by Acoustic Telemetry.
W91-02782 7B

Effects of Oil Spills on Macro-Invertebrates of Saltmarshes and Mangrove Forests in Botany Bay, New South Wales, Australia.
W91-02912 5C

SALT RIVER
Salt River Pima-Maricopa Indian Community Water Rights Settlement Act of 1988.
W91-02271 6E

Analysis of the Salt River Pima-Maricopa Indian Community Water Rights Settlement.
W91-02272 6E

SALT TOLERANCE
Rapid Evaluation of Salt Tolerance of Mangrove-Swamp Rice Varieties.
W91-02077 3C

SAMPLE PREPARATION
Geostatic Compaction Behaviour of Kaolin Muds--Effects of Different Sample Preparation Procedures.
W91-02802 2J

SAMPLE PRESERVATION
Stabilities of Carboxylic Acids and Phenols in Los Angeles Rainwaters During Storage.
W91-02800 5A

SAMPLING
Measuring Epilithic Bacterial Production in Streams.
W91-02070 2H

Arrival of a Generation of Field Expert Systems (L'Avenement d'une Generation de Systemes Expertes de Terrain).
W91-02354 7C

Sampling Intensity and Species Richness: Effects on Delineating Southwestern Riparian Plant Communities.
W91-02492 2H

Installation of a Multiport Ground-Water Sampling System in the 300 Area.
W91-02670 5A

Temporal Variability of Water Quality and the Implications for Monitoring Programmes in Irish Limestone Aquifers.
W91-02682 7A

SAN FRANCISCO BAY
Comparative Evaluation of Five Toxicity Tests with Sediments from San Francisco Bay and Tomales Bay, California.
W91-02218 5A

SANCE RESERVOIR
Water Quality in the Sance Reservoir (North Moravia).
W91-02392 5G

SAND
Runoff Generation in a Sandy Area--The Nizzana Sands, Western Negev, Israel.
W91-02811 2A

Immobile Water During Solute Transport in Unsaturated Sand Columns.
W91-02876 2G

SAND AQUIFERS
Characterizing the Hydrogeological Variability of a Sand Aquifer in the Region of a Domestic Waste Disposal Site.
W91-02692 5B

SAND FILTERS
Innovative Sludge Drying Bed Design.
W91-02426 5D

Microbial Numbers and Activity During Infiltration of Septic-Tank Effluent in a Subsurface Sand Filter.
W91-02789 5D

SANDSTONES
Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 1. Estimation of Recharge.
W91-02332 2F

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 2. Regional Investigation of Geological Structures.
W91-02333 7B

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 3. Estimation of Resources.
W91-02334 2F

SANITARY LANDFILLS
Decomposition and Elimination of Typical Pollutants from Sanitary Landfills in Porous Aquifers.
W91-02693 5B

SAPROBIC INDEX
Revision of the Saprobic System (Eine Revision des Saprobiensystems).
W91-02546 5G

SATELLITE TECHNOLOGY
Remote Sensing Applied to Glacier Supervision in the French Alps (years 1986, 1987 and 1988)(Teledetection Appliquee au suivi des Glaciers des Alpes Francaises (annees 1986, 1987 et 1988)).
W91-02051 7B

Review of Water Resources Investigation and Development Using Satellite Remotely Sensed Data of the Nazinga Game Area, Burkina Faso.
W91-02304 7B

Utilization of the ARGOS System Within the Framework of the Hydrometric Network of Benin (L'Utilisation du Systeme ARGOS dans le Cadre du Reseau Hydrometrique Beninois).
W91-02340 7B

Influence of Continental Rifting on the Hydrogeology of the Bahi Drainage Basin, Dodoma Province, Central Tanzania.
W91-02342 2F

Hydrological Network, Data Banks, and Teletransmission (Reseaux Hydrologiques, Banques de Donnees Informatisees et Teletransmission).
W91-02352 7B

Teletransmission of Hydrological Data Within the Framework of the Programme to Combat Onchocerciasis (Teletransmission des Donnees Hydrologiques dans le Cadre du Programme de Lutte Contre l'Onchocercose).
W91-02353 7B

Fluid Behavior/Waste Management in Low-Gravity Environments.
W91-02565 5D

Using Satellite Data for Mapping and Monitoring Vegetation Resources.
W91-02599 7C

Agricultural Water Use Monitoring Through Landsat Surveillance.
W91-02600 3F

Liquid Water Content and Precipitation Characteristics of Stratiform Clouds as Inferred from Satellite Microwave Measurements.
W91-02835 2E

Rainfall and Surface Kinematic Conditions Ove Central Amazonia During ABLE 2B.
W91-02841 2E

SATURATED FLOW
Methods for Measuring the Saturated Hydrauli Conductivity of Tills.
W91-02166 7I

Saturated Hydraulic Conductivity of Scandina vian Tills.
W91-02167 2I

Solution of a Nonlinear Absorption Model o Mixed Saturated-Unsaturated Flow.
W91-02872 2G

Modeling Infiltration into a Sealing Soil.
W91-02878 2G

SATURATED SOILS
Solute Transport Through Saturated Soils: Study of the Physical Non-Equilibrium Mode
W91-02090 5

SATURATION ZONE
Solution of a Nonlinear Absorption Model Mixed Saturated-Unsaturated Flow.
W91-02872 2

SAUDI ARABIA
Barium Bioaccumulation in Clams Collect from Different Salinity Regimes along the Sau Coast of the Arabian Gulf.
W91-02094 5

SAW MILLS
Leaching of Pesticides from Treated Timbers-- Source of Pollution.
W91-02844 5

SCALE FACTORS
Universal Scaling of Hydraulic Conductivit and Dispersivities in Geologic Media.
W91-02183

Spatial Uniformity of Power and the Altitudi Geometry of River Networks.
W91-02860

SCHOOLS
Adaptation of a Lead-testing Program.
W91-02765

SCOTLAND
Limitations to the Understanding of Ion-E change and Solubility Controls for Aci Welsh, Scottish, and Norwegian Sites.
W91-02735

Hydrological and Hydrochemical Flu Through Vegetation and Soil in the Allt A harcaidh, Western Cairngorms, Scotland: T Effect on Streamwater Quality.
W91-02749

Short-Term Ionic Responses as Indicators Hydrochemical Processes in the Allt A'M caidh Catchment, Western Cairngorms, S land.
W91-02750

EC Bathing Waters Directive as Applied to Scotland.
W91-02848 5G

Sludge Disposal Strategy for Dumfries and Galloway Regional Council.
W91-02850 5E

SCOUR
Controlling Mechanism of Local Scouring.
W91-02523 2J

SEA LEVEL
Dependence of Estuarine Productivity on Anomalies in Mean Sea Level.
W91-02590 2L

SEASONAL VARIATION
Seasonal Delivery of the Particulate Forms of Phosphorus to Lake Geneva from the Upper Rhone River.
W91-02448 2H

Seasonal Dynamics in Methane Emissions from the Amazon River Floodplain to the Troposphere.
W91-02834 2H

Methane Flux from the Amazon River Floodplain: Emissions During Rising Water.
W91-02837 2H

Sources and Sinks of Formic, Acetic, and Pyruvic Acids Over Central Amazonia. 2. Wet Season.
W91-02838 5B

Study on the Hydrology and Phytoplankton of the Varano Lake (Adriatic Sea) During an Annual Cycle (May 1985-April 1986). (Etude sur Lac de Varano (Mer Adriatique): Mai 1985-Avril 1986).
W91-02934 2L

SEAWATER
Determination of Photochemically Produced Hydroxyl Radicals in Seawater and Freshwater.
W91-02852 5A

SECONDARY TREATMENT
Secondary Disinfection of Service Reservoirs.
W91-02846 5F

SEDIMENT ANALYSIS
Source, Composition and Flux of Polycyclic Aromatic Hydrocarbons in Sediments of the River Derwent, Derbyshire, U.K.
W91-02079 5B

DDT Contamination of Benthic Macroinvertebrates and Sediments from Tributaries of Wheeler Reservoir, Alabama.
W91-02442 5B

Microbial Colonization of Aquifer Sediment Exposed in a Groundwater Well in Northern Germany.
W91-02767 2F

SEDIMENT CHEMISTRY
Effects of Iron Cycling on Pb-210 Dating of Sediments in an Adirondack Lake, USA.
W91-02071 2J

Sediment Oxygen Demand Model: Methane and Ammonia Oxidation.
W91-02576 2H

Sediment-Water-Equilibria: The Sorption of Volatile Chlorinated Hydrocarbons and Dichloro Benzenes by Sediments. (Sediment-Wasser-Gleichgewichte: Verhalten fluchtiger Chlorkohlenwasserstoffe und der Dichlorbenzole an Gewassersedimenten).
W91-02668 5B

Use of Kinetic Bioassay Procedure to Estimate Sulfate and Cysteine Concentrations in Sediment.
W91-02796 2H

SEDIMENT CONCENTRATION
Investigation of the Coagulation Mechanism of the Suspended Particulate Matter in Coastal Waters.
W91-02083 2J

Field Verification of 2-D and 3-D Suspended-Sediment Models.
W91-02527 2J

SEDIMENT CONTAMINATION
Total Heavy Metal Concentrations Contained on the Sediment's Surface of Algiers Bay.
W91-02053 5B

Effects of Iron Cycling on Pb-210 Dating of Sediments in an Adirondack Lake, USA.
W91-02071 2J

Source, Composition and Flux of Polycyclic Aromatic Hydrocarbons in Sediments of the River Derwent, Derbyshire, U.K.
W91-02079 5B

PAH and Organic Content of Sediment Particle Size Fractions.
W91-02080 5B

Short-Term Lethality and Sediment Avoidance Assays with Endrin-Contaminated Sediment and Two Oligochaetes from Lake Michigan.
W91-02199 5C

Population-Specific Toxicity Responses by the Freshwater Oligochaete, Stylodrilus heringianus, in Natural Lake Michigan Sediments.
W91-02213 5C

Comparative Evaluation of Five Toxicity Tests with Sediments from San Francisco Bay and Tomales Bay, California.
W91-02218 5A

DDT Contamination of Benthic Macroinvertebrates and Sediments from Tributaries of Wheeler Reservoir, Alabama.
W91-02442 5B

Persistence of Spilled Crude Oil in a Tropical Intertidal Environment.
W91-02556 5B

Metal-Organic Associations in Sediments--I. Comparison of Unpolluted Recent and Ancient Sediments and Sediments Affected by Anthropogenic Pollution.
W91-02891 5B

Integrated Chemical and Biological Study of the Bioavailability of Metals in Sediments from Two Contaminated Harbours in New Brunswick, Canada.
W91-02931 5B

SEDIMENT CONTROL
Bugle Lake Protection and Rehabilitation Project.
W91-02621 5G

SEDIMENT DISTRIBUTION
Influence of Sediment Disturbance and Water Flow on the Growth of the Soft-Shell Clam, Mya arenaria L.
W91-02062 2L

SEDIMENT DISTURBANCE
Influence of Sediment Disturbance and Water Flow on the Growth of the Soft-Shell Clam, Mya arenaria L.
W91-02062 2L

SEDIMENT LOAD
Stream Sediment Loading and Rainfall--A Look at the Issue.
W91-02086 2B

SEDIMENT OXYGEN DEMAND
Sediment Oxygen Demand Model: Methane and Ammonia Oxidation.
W91-02576 2H

SEDIMENT TRANSPORT
Controlling Mechanism of Local Scouring.
W91-02523 2J

Field Verification of 2-D and 3-D Suspended-Sediment Models.
W91-02527 2J

Large-scale Floodplain Modelling.
W91-02808 2E

Turbulent Shear Stress in Heterogeneous Sediment-Laden Flows.
W91-02923 2J

First Step Away from Lacey's Regime Equations.
W91-02924 8B

Bed Configurations in Steady Unidirectional Water Flows: Part II. Synthesis of Flume Data.
W91-02926 2E

Bed Configurations in Steady Unidirectional Water Flows: Part III. Effects of Temperature and Gravity.
W91-02927 2E

Flume Experiments on the Transport of Heavy Minerals in Gravel-Bed Streams.
W91-02928 2J

Glaciomarine Sedimentation in Disraeli Fjiord, High Arctic Canada.
W91-02929 2J

SEDIMENT-WATER INTERFACES
Influence of Sediment Disturbance and Water Flow on the Growth of the Soft-Shell Clam, Mya arenaria L.
W91-02062 2L

Sediment-Water-Equilibria: The Sorption of Volatile Chlorinated Hydrocarbons and Dichloro Benzenes by Sediments. (Sediment-Wasser-Gleichgewichte: Verhalten fluchtiger Chlorkohlenwasserstoffe und der Dichlorbenzole an Gewassersedimenten).
W91-02668 5B

SEDIMENTARY BASINS
Fan-Delta and Braid-Delta Systems in Pennsylvanian Sandia Formation, Taos Trough, Northern New Mexico: Depositional and Tectonic Implications.
W91-02519 2J

Origin and Evolution of Formation Waters, Alberta Basin, Western Canada Sedimentary Basin. II. Isotope Systematics and Water Mixing.

SEDIMENTARY STRUCTURES
Halite Depositional Facies in a Solar Salt Pond: A Key to Interpreting Physical Energy and Water Depth in Ancient Deposits.
W91-02152 2J

Bed Configurations in Steady Unidirectional Water Flows: Part I. Scale Model Study Using Fine Sands.
W91-02925 2E

Bed Configurations in Steady Unidirectional Water Flows: Part II. Synthesis of Flume Data.
W91-02926 2E

Bed Configurations in Steady Unidirectional Water Flows: Part III. Effects of Temperature and Gravity.
W91-02927 2E

SEDIMENTATION
Till Genesis and Hydrogeological Properties.
W91-02165 2F

Effects of Glacial Surging on Sedimentation in a Modern Ice-Contact Lake, Alaska.
W91-02520 2J

Bed Configurations in Steady Unidirectional Water Flows: Part III. Effects of Temperature and Gravity.
W91-02927 2E

Glaciomarine Sedimentation in Disraeli Fjiord, High Arctic Canada.
W91-02929 2J

SEDIMENTOLOGY
Geostatic Compaction Behaviour of Kaolin Muds--Effects of Different Sample Preparation Procedures.
W91-02802 2J

SEDIMENTS
Metal-Organic Associations in Sediments--II. Algal Mats in Contact with Geothermal Waters.
W91-02892 2J

SEEPAGE
Relationship of Reservoir Biogeochemical Processes to the Structural Integrity of the World's First Totally Roller Compacted Concrete Dam.
W91-02399 8F

Hydraulic Fracture in Earth and Rock-Fill Dams.
W91-02942 8A

SEICHES
Re-Examination of Seiche Periods of Lake Vattern.
W91-02593 2H

SEISMIC PROPERTIES
Monitoring System for Detecting Movements of Penstock Supports.
W91-02113 8G

Simulation of Downhole and Crosshole Seismic Tests on Sand Using the Hydraulic Gradient Similitude Method.
W91-02939 7B

SEISMIC WAVES
Simulation of Downhole and Crosshole Seismic Tests on Sand Using the Hydraulic Gradient Similitude Method.
W91-02939 7B

SEISMOLOGY
Simulation of Downhole and Crosshole Seismic Tests on Sand Using the Hydraulic Gradient Similitude Method.
W91-02939 7B

SELECTIVE WITHDRAWAL
Freshwater Withdrawals in Texas, 1985.
W91-02228 7C

SELENIUM
Organic Selenium Distribution in Selected California Soils.
W91-02134 5B

Selenium Teratogenesis in Natural Populations of Aquatic Birds in Central California.
W91-02206 5C

Avoidance of Selenium-Treated Food by Mallards.
W91-02214 5C

Toxicity of Inorganic and Organic Selenium to Daphnia magna (Cladocera) and Chironomus riparus (Diptera).
W91-02216 5C

Cost Supplement to Technologies and Costs for the Removal of Selenium from Potable Water Supplies.
W91-02728 5F

SEMIARID CLIMATES
Soil and Vegetation Responses to Sewage Sludge on a Degraded Semiarid Broom Snakeweed/Blue Grama Plant Community.
W91-02076 5E

Precipitation Fluctuation over Semiarid Regions in Northern China and the Relationship with El Nino/Southern Oscillation.
W91-02446 2B

SEMIARID LANDS
State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa.
W91-02288 2A

General Characteristics of Surface Hydrology in Arid and Semi-arid Areas of Africa and Their Consequences for Development (Caracteres Generaux de l'Hydrologie Superficielle des Zones Arides et Semi-Arides en Afrique: Leurs Consequences sur les Etudes des Ingenieurs).
W91-02290 2E

Hydrological Modelling for Water Management in Arid and Semi-arid Areas of Africa.
W91-02291 2A

CIEH's Contribution to the Development of Hydrology in Arid and Semi-Arid Areas in Africa (Contribution du CIEH au Developpement de l'Hydrologie dans les Zones Arides et Semi-arides d'Afrique).
W91-02292 2A

Towards a Regional Water Resource Study of Arid and Semi-arid Africa.
W91-02295 2A

Impact of Soil Surface Deterioration on Runoff Production in the Arid and Semi-arid Zones of West Africa.
W91-02296 4C

Review of Water Resources Investigation and Development Using Satellite Remotely Sensed Data of the Nazinga Game Area, Burkina Faso.
W91-02304 7B

Predetermination of Floods in Small Sahelian Basins under 10 Square Kilometers (La Predeterminatione des Crues sur des Petits Bassins Saheliens Inferieurs a 10 km2).
W91-02305 2E

Use of the Gould Probability Matrix Method of Reservoir Design in Arid and Semi-Arid Regions.
W91-02306 8A

Problem of Water Balance Modelling under Semi-arid Conditions.
W91-02307 7C

Some Examples of Important Problems Connected to Rainfall-Runoff Modelling in Semi-Arid Zone.
W91-02308 7C

Hydrologic Design and Development of Hydraulic Structures.
W91-02312 8A

Quantifying the Water Balance of Dryland Millet in Niger Using State of the Art Evaporation Techniques.
W91-02316 3F

Natural Groundwater Recharge Estimation in (Semi-)Arid Zones: Some State-of-the-Art Observations.
W91-02318 2F

Aquifer Characteristics in the Sedimentary Basins of the Semi-Arid and Arid Areas of Kenya.
W91-02329 2F

Hydraulic Properties of Four Soils in Niger and Implications for Water Balance Studies.
W91-02330 2G

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 1. Estimation of Recharge.
W91-02332 2F

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 2. Regional Investigation of Geological Structures.
W91-02333 7B

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 3. Estimation of Resources.
W91-02334 2F

Utilization of the Law of Gaps for the Description of the Pluviometric Regime (L'Utilisation de la Loi des Fuites pour la Description des Regimes Pluviometriques).
W91-02345 2B

Controls and Effects of Continental Brine Formation in a Supratidal Ephemeral Lake in the Semi-arid Environment of Spencer Gulf, South Australia.
W91-02806 2H

SEMINOLE INDIANS
Florida Seminole Indian Dispute Settlement Including Water Rights Compact and Manual.
W91-02276 6E

SENEGAL RIVER
Hydrology and River Control on the Niger and Senegal.
W91-02358 2E

SENSITIVITY ANALYSIS
Relating Empirical Water Quality Diagrams and Plankton-Dynamical Models: The SAMPLE Methodology Applied to a Drinking Water Storage Reservoir.
W91-02395 5I

Sensitivity Analysis of Nine Diversity and Seve Similarity Indices.
W91-02534 2I

Coupled Inverse Problems in Groundwate Modeling: 1. Sensitivity Analysis and Paramete Identification.
W91-02879 7C

SEPARATION TECHNIQUES
Recovery of Mineral Salts and Potable Wate from Desalting Plant Effluents by Evaporatio Part II. Proposed Simulation System for Sa Recovery.
W91-02402 3A

Solvent Sublation of Hexachlorobutadiene ar 2,4,6-Trichlorophenol.
W91-02403 5D

SEPTIC TANKS
Septic Tank and Agricultural Non-Point Sour Pollution Within a Rural Watershed.
W91-02177 5B

Microbial Numbers and Activity During Inf tration of Septic-Tank Effluent in a Subsurfa Sand Filter.
W91-02789 5B

SESTON
Long-term Trends in the Seston Content of a Shallow Eutrophic Lake and Some Relations to Climatic Elements.
W91-02374 2H

Ecology of Lowland Zegrzynski Reservoir near Warsaw.
W91-02389 2H

Influence of Impoundments on Phytoseston Biomass of Two Small Lowland Rivers-Skierniewka and Rawka in 1983.
W91-02390 2H

SEWAGE SLUDGE
Effect of Sewage Sludge on Nutrient and Toxic Metal Content of Soil and Selected Crops Grown on Tropical Soils.
W91-02239 5C

SEWER SYSTEMS
Sliplining Rescues Sewers and a Small Budget.
W91-02424 8A

Head Losses in Storm Sewer Manholes: Submerged Jet Theory.
W91-02916 8B

SHATT AL-ARAB RIVER
Tigris-Euphrates Delta: A Major Source of Pesticides to the Shatt al-Arab River (Iraq).
W91-02463 5B

SHEAR STRESS
Turbulent Shear Stress in Heterogeneous Sediment-Laden Flows.
W91-02923 2J

SHOALS
Mississippi River-Gulf Outlet, Louisiana: Field Data Report.
W91-02604 2E

SHRIMP
Distribution of Shrimp and Fish By-Catch Assemblages in the Canadian Eastern Arctic in Relation in Water Circulation.
W91-02066 2L

Uptake of Cadmium and Nickel in Banana Prawn (Penaeus merguiensis de Man).
W91-02093 5B

Methylparathion-Induced Alterations in the Acetylcholinesterase and Phosphatases in a Penaeid Prawn, Metapenaeus monoceros.
W91-02097 5C

Toxicity Testing of Sublethal Effects of Dredged Materials.
W91-02461 5C

Effects of Wastewater Treatment and Seawater Dilution in Reducing Lethal Toxicity of Municipal Wastewater to Sheepshead Minnow (Cyprinodon variegatus) and Pink Shrimp (Penaeus duorarum).
W91-02535 5D

ILVER
Accumulation from Water and Depuration of 110mAg by a Freshwater Fish, Salmo trutta L.
W91-02798 5B

ILVEX
Drinking Water Criteria Document for 2(2,4,5-Trichlorophenoxy) Propionic Acid (2,4,5-TP).
W91-02732 5G

IMULATION ANALYSIS
Supercomputers and Their Use in Modeling Subsurface Solute Transport.
W91-02543 7C

Combined Simulation of Canopy Reflectance and Thermal Response for Estimating Evapotranspiration.
W91-02595 2D

SITE REMEDIATION
Superfund Record of Decision: Todtz, Lawrence Farm, IA. First Remedial Action--Final.

Fluvial Dynamics and Succession in the Lower Ucayali River Basin, Peruvian Amazonia.
W91-02480 2E

Palm Communities in Wetland Forest Ecosystems of Peruvian Amazonia.
W91-02482 2H

Flooding and Saltwater Intrusion: Potential Effects on Survival and Productivity of Wetland Forests Along the U.S. Gulf Coast.
W91-02489 4C

Comparative Study of the Response of Taxodium distichum and Nyssa aquatica Seedlings to Soil Anaerobiosis and Salinity.
W91-02500 2E

Soil Water Relations on a Hilltop Cornfield in Central Appalachia.
W91-02592 2G

Remote Sensing Applications for Consumptive Use (Evapotranspiration).
W91-02594 7B

Some Aspects of Soil Moisture Control for Soils with Shallow Groundwater Levels.
W91-02674 2G

Hydrological and Hydrochemical Fluxes Through Vegetation and Soil in the Allt A'Mharcaidh, Western Cairngorms, Scotland: Their Effect on Streamwater Quality.
W91-02749 5B

SOIL WATER POTENTIAL

Calibration of Time Domain Reflectometry for Water Content Measurement Using a Composite Dielectric Approach.
W91-02857 2G

SOIL WATER TABLE

Relating Soil Color to Soil Water Table Levels.
W91-02533 2G

SOLAR ENERGY

PULSA SOLAR: Solar Water Oscillation Pumps for Village Hydraulics.
W91-02347 5F

SOLID WASTES

Performances of Digesters Treating the Organic Fraction of Municipal Solid Wastes Differently Sorted.
W91-02775 5D

SOLUTE TRANSPORT

Solute Transport Through Saturated Soils: A Study of the Physical Non-Equilibrium Model.
W91-02090 5B

Hydrogeochemical Processes Controlling the Transport of Dissolved Organic Carbon Through a Forested Hillslope.
W91-02159 5B

Adsorptive Solute Transport in Fractured Rock: Analytical Solutions for Delta-Type Source Conditions.
W91-02164 5B

Modeling of Multicomponent Transport with Microbial Transformation in Groundwater: The Fuhrberg Case.
W91-02180 5B

Predicting Concentrations of Consumer Product Chemicals in Estuaries.
W91-02211 5B

Supercomputers and Their Use in Modeling Subsurface Solute Transport.
W91-02543 7C

Coupling of Chemistry and Transport.
W91-02694 5B

Identification of Unsaturated Solute Transport Parameters.
W91-02695 5B

Stochastic Control of Contaminant Transport Problems.
W91-02696 5G

Target Level Groundwater Management Model with Linearized Flow and Transport Constraints.
W91-02704 2F

Effects of Vegetation Type on the Biogeochemistry of Small Catchments (Mont Lozere France).
W91-02742 2K

Preliminary Analysis of Water and Solute Movement Beneath a Coniferous Hillslope in Mid Wales, U. K.
W91-02746 2E

Geochemical Control of Aluminium Concentrations in Acidified Surface Waters.
W91-02752 5I

Analytical Solution for One-Dimensional Transport in Heterogeneous Porous Media.
W91-02863 5I

Some Anomalous Features of Flow and Solute Transport Arising from Fracture Aperture Variability.
W91-02867 2I

Estimating Groundwater Exchange with Lakes 2. Calibration of a Three-Dimensional, Solute Transport Model to a Stable Isotope Plume
W91-02874 2I

Uncertainty Propagation with Numerical Models for Flow and Transport in the Unsaturated Zone.
W91-02875 2G

Immobile Water During Solute Transport in Unsaturated Sand Columns.
W91-02876 2G

Numerical Simulation of Solute Transport in Three-Dimensional, Randomly Heterogeneous Porous Media.
W91-02881 5B

Analytical Traveling Wave Solutions for Transport with Nonlinear and Nonequilibrium Adsorption.
W91-02882 2G

Application of the Arnoldi Algorithm to the Solution of the Advection-Dispersion Equation
W91-02883 5

Stochastic Analysis of the Concentration Variability in a Three-Dimensional Heterogeneous Aquifer.
W91-02884 2F

SOLVENT SUBLATION
Solvent Sublation of Hexachlorobutadiene and 2,4,6-Trichlorophenol.
W91-02403 5D

SOLVENTS
Organic Solvent-Soluble Contents of Nickel and Cobalt in Some Algae.
W91-02401 5B

Solvent Sublation of Hexachlorobutadiene and 2,4,6-Trichlorophenol.
W91-02403 5D

SORPTION
Application of Two-Site/Two-Region Models for Studying Simultaneous Nonequilibrium Transport and Degradation of Pesticides.
W91-02132 5B

Sediment-Water-Equilibria: The Sorption of Volatile Chlorinated Hydrocarbons and Dichloro Benzenes by Sediments. (Sediment-Wasser-Gleichgewichte: Verhalten fluchtiger Chlorkohlenwasserstoffe und der Dichlorbenzole an Gewassersedimenten).
W91-02668 5B

SOUTH AMERICA
Status and Distribution of Forested Wetlands in Tropical South America.
W91-02477 2H

SOUTH CAROLINA
Water Resources Data for South Carolina, Water Year 1989.
W91-02637 7C

Water Resources Data for South Dakota, Water Year 1989.
W91-02638 7C

SOUTH DAKOTA
U. S. Geological Survey Applied Research Studies of the Cheyenne River System, South Dakota: Description and Collation of Data, Water Years 1987-88.
W91-02235 5B

SOYBEANS
Screening for Drought Tolerance: Soybean Germination and Its Relationship to Seedling Responses.
W91-02074 3F

SPAIN
Annual and Longitudinal Changes in the Environmental Conditions in Three Consecutive Reservoirs of the Guadiana River (W. Spain).
W91-02372 2H

Longitudinal Differentiation According to Environmental Factors and Phytoplankton in Aracena and La Minilla Reservoirs (Sevilla, Spain).
W91-02379 2H

Wetlands and Groundwater: New Constraints in Groundwater Management.
W91-02722 6G

SPATIAL DISTRIBUTION
Spatial Differences and Temporal Trends of Organochlorine Compounds in Biota from the Northwestern Hemisphere.
W91-02467 5B

Identification of Large-Scale Spatial Trends in Hydrologic Data.
W91-02870 7C

SPAWNING
Breeding Biology of the Spotted Salamander Ambystoma maculatum (Shaw) in Acidic Temporary Ponds at Cape Cod, USA.
W91-02550 5C

SPECIATION
Effect of Solid-Phase Speciation on Metal Mobility and Phytoavailability in Sludge-Amended Soil.
W91-02089 5E

SPECIES COMPOSITION
Factors Influencing Community Structure and Distribution of Different Life-Cycle Categories of Fishes in Shallow Waters of a Large Australian Estuary.
W91-02123 2L

Southwestern Riparian Plant Communities: Site Characteristics, Tree Species Distributions, and Size-class Structures.
W91-02491 2H

Sampling Intensity and Species Richness: Effects on Delineating Southwestern Riparian Plant Communities.
W91-02492 2H

Classification of Mangrove Forest by Using 1:40,000-Scale Aerial Photographs.
W91-02504 2H

Planktonic Community Structure Determines the Fate of Bacterial Production in a Temperate Lake.
W91-02585 2H

SPECIES DIVERSITY
Distribution of Shrimp and Fish By-Catch Assemblages in the Canadian Eastern Arctic in Relation in Water Circulation.
W91-02066 2L

Wetland and Upland Forest Ecosystems in Peruvian Amazonia: Plant Species Diversity in the Light of Some Geological and Botanical Evidence.
W91-02479 2H

Effects of Pool Size and Isolation on Amphibian Communities.
W91-02517 2H

Sensitivity Analysis of Nine Diversity and Seven Similarity Indices.
W91-02534 2H

SPECTROPHOTOMETRY
Analytical Properties of 4,4'-Biazobenzenediazoaminobenzene and Its Applications in Spectrophotometry.
W91-02548 5A

SPHAGNUM
Growth, Production, and Decomposition Dynamics of Sphagnum Under Natural and Experimentally Acidified Conditions.
W91-02404 5C

SQUALLS
Tropical Squall Line Observed During the COPT 81 Experiment in West Africa. Part III: Heat and Moisture Budgets.
W91-02761 2B

STABILIZATION PONDS
Ecology of a Southern Ohio Stream Receiving Fly Ash Pond Discharge: Changes from Acid Mine Drainage Conditions.
W91-02208 5C

STABLE ISOTOPES
Hydrogeochemical and Isotopical Investigations of Ground and Surfacewaters at the Southwest Edge of the Harzmountains during an Artificial Induced High Water (Hydrogeochemische und Isotopenchemische Untersuchungen an Grund und Oberflachenwassern am Sudwestrand des Harzes Wahrend eines Kunstlich Induzierten Hochwassers).
W91-02545 2K

STAGNANT WATER
Measurement and Calculation of Dinitrogen Fixation in Water Bodies.
W91-02378 2K

STANDARDS
Modeling Inactivation of Giardia lamblia.
W91-02570 5F

Guidelines for Physical and Biological Monitoring of Aquatic Dredged Material Disposal Sites.
W91-02607 5A

Guidance Manual for Compliance with the Filtration and Disinfection Requirements for Public Water Systems Using Surface Water Sources.
W91-02623 5F

Drinking Water Criteria Document for Toluene.
W91-02731 5G

Drinking Water Criteria Document for Toxaphene.
W91-02733 5G

STATE JURISDICTION
State Goals in Indian Water Rights Disputes.
W91-02269 6E

Siting and Technology Pose Challenges for Communities Ending Ocean Disposal of Sludge.
W91-02955 5D

STATISTICAL ANALYSIS
Evaluation of the Sea Urchin Echinometra Iucunter as an Indicator of Heavy-Metal Contamination in Cuba (Evaluacion del Erizo de Mar Echinometra Iucunter como Indicator de Contaminacion por Metales Pesados, Cuba).
W91-02044 5A

Ratios in Aquatic Sciences: Statistical Shortcomings with Mean Depth and the Morphoedaphic Index.
W91-02069 7C

Streamflow Data and Surface-Water Resource Assessment - A Quantitative Demonstration of Need for Adequate Investment in Data Collection in Developing Countries.
W91-02141 7A

Three-Dimensional Statistical Moment Analysis of the Stanford/Waterloo Borden Tracer Data.
W91-02182 5B

Approximation of Confidence Limits on Sample Semivariograms from Single Realizations of Spatially Correlated Random Fields.
W91-02187 7C

Analysis of Non-Stationarity of West African Rainfall and Hydrological Series (Analyse de la Non Stationnarite des Series Pluviometriques et Hydrologiques d'Afrique de l'Ouest).
W91-02302 2B

Utilization of the Law of Gaps for the Description of the Pluviometric Regime (L'Utilisation de la Loi des Fuites pour la Description des Regimes Pluviometriques).
W91-02345 2B

Oil Slick Sizes and Length of Coastline Affected: A Literature Survey and Statistical Analysis--Final Report.
W91-02671 5B

Identification of Large-Scale Spatial Trends in Hydrologic Data.
W91-02870 7C

LIBRARY U. OF I. URBANA-CHAMPAIGN

STATISTICAL ANALYSIS

Hydrogeologic Assessment of Exposure to Solvent-Contaminated Drinking Water: Pregnancy Outcomes in Relation to Exposure.
W91-02935 5C

Decontamination Technologies for Release from Bioprocessing Facilities: Part VI. Verification of Wastewater Decontamination.
W91-02937 5D

STATISTICAL METHODS

Anthropogenic Influence on the Interelemental Correlation in Different Phases of the Marine Environment.
W91-02175 5B

Approximation of Confidence Limits on Sample Semivariograms from Single Realizations of Spatially Correlated Random Fields.
W91-02187 7C

Estimation of the Transmissivity of the Santiago Aquifer, Chile, Using Different Geostatistical Methods.
W91-02679 2F

STATISTICAL MODELS

Some Anomalous Features of Flow and Solute Transport Arising from Fracture Aperture Variability.
W91-02867 2F

STATISTICS

Outliers in Groundwater Quality Time Series.
W91-02687 7C

STEADY FLOW

Explicit Calculation of Pipe-Network Parameters.
W91-02917 8B

STERILIZATION

Decontamination Technologies for Release from Bioprocessing Facilities: Part VI. Verification of Wastewater Decontamination.
W91-02937 5D

STOCHASTIC MODELS

Stochastic Analysis of the Concentration Variability in a Three-Dimensional Heterogeneous Aquifer.
W91-02884 2F

Periodic-Stochastic Modeling of Separation of Precipitation into Rainfall and Snowfall.
W91-02886 2B

STORAGE RESERVOIRS

Hydrologic Design and Development of Hydraulic Structures.
W91-02312 8A

Hydrology and River Control on the Niger and Senegal.
W91-02358 2E

Relating Empirical Water Quality Diagrams and Plankton-Dynamical Models: The SAMPLE Methodology Applied to a Drinking Water Storage Reservoir.
W91-02395 5F

STORAGE TANKS

Containment of Organic Leachates from Leaking Underground Storage Tanks Using Tailored Soils as Liners.
W91-02648 5G

STORM RUNOFF

Hydrogeochemical Processes Controlling the Transport of Dissolved Organic Carbon Through a Forested Hillslope.
W91-02159 5B

Floods of February 1989 in Tennessee.
W91-02260 4A

Frequency-Related Temporally and Spatially Varied Rainfall.
W91-02524 2B

Origins of Acid Runoff in a Hillslope During Storm Events.
W91-02737 5C

Stormflow Hydrochemistry of a Small Welsh Upland Catchment.
W91-02748 2K

Runoff Generation in a Sandy Area--The Nizzana Sands, Western Negev, Israel.
W91-02811 2A

STORM SEWERS

Head Losses in Storm Sewer Manholes: Submerged Jet Theory.
W91-02916 8B

STORM WASTEWATER

Operational Water Quality Management: Control of Storm Sewage at a Wastewater Treatment Plant.
W91-02541 5D

STORM WATER

Stormflow Hydrochemistry of a Small Welsh Upland Catchment.
W91-02748 2K

STORMS

Doppler-Radar Analysis of a Low-Precipitation Severe Storm.
W91-02760 2B

Tropical Squall Line Observed During the COPT 81 Experiment in West Africa. Part III: Heat and Moisture Budgets.
W91-02761 2B

STRATIFIED DRIFT

Upland Runoff as a Major Source of Recharge to Stratified Drift in the Glaciated Northeast.
W91-02282 2F

Evaluation of the Continuous Seismic-Reflection Method for Determining the Thickness and Lithology of Stratified Drift in the Glaciated Northeast.
W91-02284 7B

Geochemistry of the Stratified-Drift Aquifer in Killbuck Creek Valley West of Wooster, Ohio.
W91-02286 2F

Use of Oxygen-18 and Deuterium Mass-Balance Analysis to Evaluate Induced Recharge to Stratified-Drift Aquifers.
W91-02287 2F

STRATIFIED FLOW

Split of Two-Phase Flow at a Horizontal T-Annular and Stratified Flow.
W91-02613 8B

STREAM BANKS

Assessment of Bank Slope as a Predictor of Conservation Status in River Corridors.
W91-02516 2H

Soil Water in the Riparian Zone as a Source of Carbon for a Headwater Stream.
W91-02747 2H

STREAM BIOTA

Spatial Organization and Population Density of the Fish Community of the Litter Banks within a Central Amazonian Blackwater Stream.
W91-02414 2H

Field Study of the Effects of Water Temperature, Discharge and Trout Odour on the Drift of Stream Invertebrates.
W91-02454 2H

Overview of Case Studies on Recovery of Aquatic Systems from Disturbance.
W91-02898 5G

Recovery of Lotic Periphyton Communities after Disturbance.
W91-02899 2H

Recovery of Lotic Macroinvertebrate Communities from Disturbance.
W91-02900 2H

Physical Habitat Template of Lotic Systems: Recovery in the Context of Historical Pattern of Spatiotemporal Heterogeneity.
W91-02902 2H

Disturbance Regimes, Resilience, and Recovery of Animal Communities and Habitats in Lotic Ecosystems.
W91-02903 2H

Assemblage Stability in Stream Fishes: A Review.
W91-02904 2H

Biogeochemical Cycling Constraints on Stream Ecosystem Recovery.
W91-02906 2H

Role of Refugia in Recovery from Disturbances: Modern Fragmented and Disconnected River Systems.
W91-02908 2H

Recovery Processes in Lotic Ecosystems: Limits of Successional Theory.
W91-02909 2H

Island Biogeographical Theory: Can It Be Used to Predict Lotic Recovery Rates.
W91-02910 2E

STREAM DISCHARGE

Preparation of Average Annual Runoff Map of the United States, 1951-80.
W91-02247 7C

Physical, Chemical and Hydrographic Investigations of an Upland Stream: A Contribution on the Standardization of Small Watercourses (Physikalische, chemische und hydrographische Untersuchungen Einesc Mittelgebirgsbaches: Ein Beitrag zur Typisierung kleiner Fliessgewasser).
W91-02449 2E

Field Study of the Effects of Water Temperature, Discharge and Trout Odour on the Drift of Stream Invertebrates.
W91-02454 2H

Velocity-Discharge Relationships in Three Lowland Rivers.
W91-02807 7B

Climatic Influences on Streamflow Variability: A Comparison Between Southeastern Australia and Southeastern United States of America.
W91-02877 2B

STREAM EROSION

Prediction on Eutrophication of Reservoir Yuqiao.
W91-02383 5G

STREAM FISHERIES

Distribution of California Stream Fishes: Influence of Environmental Temperature and Hypoxia.
W91-02518 2H

Environmental Variation, Life History Attributes, and Community Structure in Stream Fishes: Implications for Environmental Management and Assessment.
W91-02901 2H

Assemblage Stability in Stream Fishes: A Review.
W91-02904 2H

Regional Framework for Establishing Recovery Criteria.
W91-02905 2H

STREAM GAGING
Velocity-Discharge Relationships in Three Lowland Rivers.
W91-02807 7B

STREAM IMPROVEMENT
Lack of Theoretical Basis for Predicting Rate and Pathways of Recovery.
W91-02895 5G

Indicators of Ecosystem Recovery.
W91-02896 5G

Recovery of Lotic Communities and Ecosystems from Disturbance--A Narrative Review of Case Studies.
W91-02897 5G

STREAM PROFILES
Physical, Chemical and Hydrographic Investigations of an Upland Stream: A Contribution on the Standardization of Small Watercourses (Physikalische, chemische und hydrographische Untersuchungen Einesc Mittelgebirgsbaches: Ein Beitrag zur Typisierung kleiner Fliessgewasser).
W91-02449 2E

STREAMBEDS
Occurrence, Relative Abundance, and Size of Landlocked Sea Lamprey (Petromyzon marinus) Ammocoetes in Relation to Stream Characteristics in the Great Lakes.
W91-02068 2H

STREAMFLOW
Mass-Conserving Method of Characteristics for Streamflow Modeling.
W91-02234 2E

Possible Effects of Residential Development on Streamflow, Riparian Plant Communities, and Fisheries on Small Mountain Streams in Central Arizona.
W91-02493 4C

Potential for Enhancing Riparian Habitats in the Southwestern United States with Watershed Practices.
W91-02495 4A

Conservative Mixing of Water Sources: Analysis of the Behaviour of the Allt a'Mharcaidh Catchment.
W91-02756 2K

STREAMFLOW DATA
Streamflow Data and Surface-Water Resource Assessment - A Quantitative Demonstration of Need for Adequate Investment in Data Collection in Developing Countries.
W91-02141 7A

Gamma-Autoregressive Models for Stream-Flow Simulation.
W91-02922 2E

STREAMFLOW DEPLETION
Application of Groundwater Modelling in Water Resources Management in Denmark.
W91-02719 5B

STREAMFLOW FORECASTING
Streamflow Data and Surface-Water Resource Assessment - A Quantitative Demonstration of Need for Adequate Investment in Data Collection in Developing Countries.
W91-02141 7A

Use of the Gould Probability Matrix Method of Reservoir Design in Arid and Semi-Arid Regions.
W91-02306 8A

Climatic Influences on Streamflow Variability: A Comparison Between Southeastern Australia and Southeastern United States of America.
W91-02877 2B

Gamma-Autoregressive Models for Stream-Flow Simulation.
W91-02922 2E

STREAMS
Characteristics of Coarse Wood Debris for Several Coastal Streams of Southeast Alaska, USA.
W91-02063 4C

Measuring Epilithic Bacterial Production in Streams.
W91-02070 2H

Patterns and Controls of Nitrogen in Tallgrass Prairie Streams.
W91-02405 2H

DDT Contamination of Benthic Macroinvertebrates and Sediments from Tributaries of Wheeler Reservoir, Alabama.
W91-02442 5B

Physical, Chemical and Hydrographic Investigations of an Upland Stream: A Contribution on the Standardization of Small Watercourses (Physikalische, chemische und hydrographische Untersuchungen Einesc Mittelgebirgsbaches: Ein Beitrag zur Typisierung kleiner Fliessgewasser).
W91-02449 2E

Utility of Stream Habitat and Biota for Identifying Potential Conflicting Forest Land Uses: Montane Riparian Areas.
W91-02494 4C

Potential for Enhancing Riparian Habitats in the Southwestern United States with Watershed Practices.
W91-02495 4A

Reversal of Stream Acidification at the Birkenes Catchment, Southern Norway: Predictions Based on Potential ANC Changes.
W91-02739 5B

Longitudinal Patterns of Concentration-Discharge Relationships in Stream Water Draining the Hubbard Brook Experimental Forest, New Hampshire.
W91-02743 5B

Precipitation, Throughfall, Soil Solution and Streamwater Chemistry in a Holm-Oak (Quercus ilex) Forest.
W91-02744 2K

Hydrogeochemical Variations in Hafren Forest Stream Waters, Mid-Wales.
W91-02745 4C

Soil Water in the Riparian Zone as a Source of Carbon for a Headwater Stream.
W91-02747 2H

Geochemical Control of Aluminium Concentrations in Acidified Surface Waters.
W91-02752 5B

Modelling Streamwater Chemistry as a Mixture of Soilwater End-Members--A Step Towards Second-Generation Acidification Models.
W91-02753 5B

Conservative Mixing of Water Sources: Analysis of the Behaviour of the Allt a'Mharcaidh Catchment.
W91-02756 2K

Method for Predicting the Extremes of Stream Acidity and Other Water Quality Variables.
W91-02757 5B

STREAMSIDE MANAGEMENT UNIT
Streamside Management Units in the Pacific Northwest.
W91-02497 6B

STRESS
Simulation of Downhole and Crosshole Seismic Tests on Sand Using the Hydraulic Gradient Similitude Method.
W91-02939 7B

STRUCTURE-ACTIVITY RELATIONSHIPS
Application of QSARs to Predict Potential Aquatic Toxicities of Organochlorine Pesticides.
W91-02178 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: I. 1,2,4-Trichlorobenzene.
W91-02436 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: II. 1,3,5-Trichlorobenzene.
W91-02437 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: III. 1,2,3-Trichlorobenzene.
W91-02438 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: IV. Pentachlorobenzene and Comparison with Trichlorobenzene Isomers.
W91-02439 5C

Structure of an Anhydride Related to a Mutagenic Component of Drinking Water, 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone.
W91-02551 5A

SUBIRRIGATION
Groundwater Management by a Dual-Pipe Subirrigation System.
W91-02677 4B

SUBLETHAL EFFECTS
Oxygen Uptake of Pseudosuccinea columella and Fossaria cubensis Treated with Sublethal Concentrations of CUTRINE-PLUS, an Algicide.
W91-02096 5C

Chronic Toxicity of Copper to a Partial Life Cycle of the Midge, Chironomus decorus.
W91-02431 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: IV. Pentachlorobenzene and Comparison with Trichlorobenzene Isomers.
W91-02439 5C

Chronic Effects of 2,2'-dichlorobiphenyl on Reproduction, Mortality, Growth, and Respiration of Daphnia pulicaria.
W91-02466 5C

SUBMERGED AQUATIC PLANTS
Aquatic and Certain Wetland Vascular Vegetation of Reelfoot Lake, 1920s-1980s. III. Submersed Macrophytes.
W91-02581 2H

SUBMERGED JETS
Head Losses in Storm Sewer Manholes: Submerged Jet Theory.
W91-02916 8B

SUBSTRATES
Modeling Transient Substrate Loads in Completely Mixed Aeration Basins at Hydraulic Steady State.
W91-02822 5D

SUBSURFACE DRAINAGE
Organic Selenium Distribution in Selected California Soils.
W91-02134 5B

SUBSURFACE MAPPING
Geophysical Methodology Applied to Rural Water Supply in Bedrock Environment: Preliminary Results (Methodologie Geophysique Appliquee a l'Hydraulique Villageoise en Zone de Socle: Resultats Preliminaires).
W91-02328 2F

SUCCESSION
Changes in Seasonal Succession of Phytoplankton Induced by the Storm-Surge Barrier in the Oosterschelde (S.W. Netherlands).
W91-02116 2L

Planktoneustonic Algae in the Surface Films of Lake Zurich: Occurrence and Dependence on Phytoplankton Succession.
W91-02451 2H

Recovery Processes in Lotic Ecosystems: Limits of Successional Theory.
W91-02909 2H

SUDAN
Evaporation from Free Water Surfaces in the Sudano-Sahelian Climate (L'evaporation des nappes d'eau libre en climat soudano-sahelien).
W91-02300 2D

Water Transfer in Porous Non-Saturated Rock and Aquifer Recharge in the Sudano-Sahelian Climate (Transfert d'Eau en Milieu Poreux non Sature Recharge des Nappes en Climat Soudano-Sahelien).
W91-02319 2F

Problems of Maintenance of Water Quality in Arid and Semi-Arid Regions of West Africa.
W91-02348 5G

SULFATES
Interaction between Sulfate Reducers and Methanogens Fed Acetate and Propionate.
W91-02537 5D

Evidence for Long-Term Deterioration of Streamwater Chemistry and Soil Acidification at the Birkenes Catchment, Southern Norway.
W91-02738 5C

Use of Kinetic Bioassay Procedure to Estimate Sulfate and Cysteine Concentrations in Sediment.
W91-02796 2H

Estimation of the Contribution of the Sulfate Ion to Rainwater Acidity.
W91-02827 5B

SULFUR
Sulfur Storage and Alkalinity Generation in New England Lake Sediments.
W91-02588 2H

Reversal of Stream Acidification at the Birkenes Catchment, Southern Norway: Predictions Based on Potential ANC Changes.
W91-02739 5B

Sulphur and Oxygen Isotopes of Dissolved Sulphur Species in Formation Waters from the Dogger Geothermal Aquifer, Paris Basin, France.
W91-02890 2K

SULFUR BACTERIA
Relationship of Reservoir Biogeochemical Processes to the Structural Integrity of the World's First Totally Roller Compacted Concrete Dam.
W91-02399 8F

Interaction between Sulfate Reducers and Methanogens Fed Acetate and Propionate.
W91-02537 5D

SULFUR CYCLE
Atmospheric Sulfur Cycle Over the Amazon Basin. 2. Wet Season.
W91-02839 5B

SULFUR ISOTOPES
Sulphur and Oxygen Isotopes of Dissolved Sulphur Species in Formation Waters from the Dogger Geothermal Aquifer, Paris Basin, France.
W91-02890 2K

SUMPS
Yazoo Backwater Pumping Station Sump, West-Central Mississippi: Hydraulic Model Investigation.
W91-02606 8B

SUPERCOMPUTERS
Supercomputers and Their Use in Modeling Subsurface Solute Transport.
W91-02543 7C

SUPERCOOLING
Physics of Supercooling of Thin Water Skins Covering Gyrating Hailstones.
W91-02119 2C

SUPERFUND
Superfund Record of Decision: Todtz, Lawrence Farm, IA. First Remedial Action--Final.
W91-02649 5G

Superfund Record of Decision: Berks Sand Pit, PA. First Remedial Action-Final.
W91-02651 5G

Superfund Record of Decision: Motorola (52nd Street Plant), AZ. First Remedial Action.
W91-02652 5G

Superfund Record of Decision: Selma Pressure Treating Company, CA. First Remedial Action--Final.
W91-02654 5G

Superfund Record of Decision: Cannon Engineering, MA. First Remedial Action--Final.
W91-02655 5G

Superfund Record of Decision: Avtex Fibers, VA. First Remedial Action.
W91-02656 5G

Superfund Record of Decision: Findett, Mo. First Remedial Action.
W91-02657 5G

Superfund Record of Decision: South Valley/Edmunds Street, NM. Second Remedial Action.
W91-02658 5G

Superfund Record of Decision: Commencement Bay/Near Shore, WA. First Remedial Action.
W91-02659 5G

Superfund Record of Decision: Mason County Landfill, MI. First Remedial Action.
W91-02660 5G

Superfund Record of Decision: United Nuclear Corporation, NM. First Remedial Action.
W91-02661 5G

Superfund Record of Decision: Southern Maryland Wood, MD. First Remedial Action--Final.
W91-02662 5G

Superfund Record of Decision: M.W. Manufacturing, PA. First Remedial Action.
W91-02663 5G

Superfund Record of Decision: South Valley/SJ-6, NM. Third Remedial Action.
W91-02664 5G

Superfund Record of Decision: Middletown Air Field, PA.
W91-02669 5G

SUPPLEMENTAL IRRIGATION
Access of Small and Marginal Farmers to Groundwater--A Field Study.
W91-02675 4B

SURFACE FLOW
Watershed Delineation with Triangle-Based Terrain Models.
W91-02525 2E

SURFACE-GROUNDWATER RELATIONS
Estimates of Ground-Water Flow Components for Lyman Lake, Apache County, Arizona, with a Section on Geochemistry of Surface Water and Ground Water in the Lyman Lake Area by Fredrick N. Robertson.
W91-02231 2F

Northeast Glacial Aquifers.
W91-02280 2F

Northeast Glacial Aquifers RASA Project--An Overview of Results through 1987.
W91-02281 2F

Upland Runoff as a Major Source of Recharge to Stratified Drift in the Glaciated Northeast
W91-02282 2F

Estimation of Water Available for Recharge to Sand and Gravel Aquifers in the Glaciated Northeastern United States.
W91-02283 2F

Use of Oxygen-18 and Deuterium Mass-Balance Analysis to Evaluate Induced Recharge to Stratified-Drift Aquifers.
W91-02287 2F

Hydrogeochemical and Isotopical Investigation of Ground and Surfacewaters at the Southwes Edge of the Harzmountains during an Artificia Induced High Water (Hydrogeochemische und Isotopenchemische Untersuchungen an Grund und Oberflachenwassern am Sudwestrand de Harzes Wahrend eines Kunstlich Induzierten Hochwassers).
W91-02545 2K

Groundwater Recharge from Lake Chad.
W91-02591 2I

Management of Groundwater-induced River Sa linity due to Land Clearing in the Murray Basin Southeastern Australia.
W91-02681 5C

Effect of Field-scale Solute Infiltration int Groundwater on Surface Water Quality.
W91-02683 5I

Finite Element Combined Surface Water Groundwater Model for the River Rhine, Kehl Strasbourg Reservoir.
W91-02716 5C

Application of Groundwater Modelling i Water Resources Management in Denmark.
W91-02719 5

Alluvial Aquifer of the Grand Gravier (Rhon Valley, France) Modelling and Protection.
W91-02721 5C

Preliminary Analysis of Water and Solute Movement Beneath a Coniferous Hillslope in Mid-Wales, U. K.
W91-02746 2E

Soil Water in the Riparian Zone as a Source of Carbon for a Headwater Stream.
W91-02747 2H

Geochemical Control of Aluminium Concentrations in Acidified Surface Waters.
W91-02752 5B

Estimating Groundwater Exchange with Lakes: 1. The Stable Isotope Mass Balance Method.
W91-02873 2F

Estimating Groundwater Exchange with Lakes: 2. Calibration of a Three-Dimensional, Solute Transport Model to a Stable Isotope Plume.
W91-02874 2F

SURFACE RUNOFF
Similarity and Length Scale for Spatially Varied Overland Flow.
W91-02189 2E

SURFACE WATER
Bibliography of U.S. Geological Survey Reports on the Water Resources of Florida, 1886-1989.
W91-02237 10C

Water Resources Data for Florida, Water Year 1989, Volume 3B: Southwest Florida Ground Water.
W91-02240 7C

Water Resources Data for Utah, Water Year 1989.
W91-02241 7C

Water Resources Data for Arkansas, Water Year 1989.
W91-02261 7C

Impact of Climatic Changes on Surface Water Resources in West and Central Africa (Impact des Changements Climatiques sur les Ressources en Eau de Surface en Afrique de l'Ouest et Centrale: L'Experience de l'OSTROM).
W91-02368 7A

Water Resources for California, Water Year 1989, Volume 3. Southern Central Valley Basins and the Great Basin from Walker River to Truckee River.
W91-02624 7C

Water Resources for Florida, Water Year 1989, Volume 2A. South Florida - Surface Water.
W91-02625 7C

Water Resources Data for Florida, Water Year 1989, Volume 2B. South Florida - Ground Water.
W91-02626 7C

Water Resources Data for Florida, Water Year 1989, Volume 3A: Southwest Florida Surface Water.
W91-02627 7C

Water Resources for California, Water Year 1989, Volume 4: Northern Central Valley Basins and the Great Basin from Honey Lake Basin to Oregon State Line.
W91-02628 7C

Water Resources Data for Massachusetts and Rhode Island, Water Year 1988.
W91-02629 7C

Water Resources Data for Missouri, Water Year 1989.
W91-02630 7C

Water Resources Data for Montana, Water Year 1989.
W91-02631 7C

Water Resources Data for New Jersey, Water Year 1989, Volume 1: Atlantic Slope Basins, Hudson River to Cape May.
W91-02632 7C

Water Resources Data for New Jersey, Water Year 1989, Volume 2: Delaware River Basin and Tributaries to Delaware Bay.
W91-02633 7C

Water Resources Data for New York, Water Year 1989, Volume 2: Long Island.
W91-02634 7C

Water Resources Data for Pennsylvania, Water Year 1989. Volume 2: Susquehanna and Potomac River Basins.
W91-02635 7C

Water Resources Data for Puerto Rico and the U.S. Virgin Islands, Water Year 1989.
W91-02636 7C

Water Resources Data for South Carolina, Water Year 1989.
W91-02637 7C

Water Resources Data for South Dakota, Water Year 1989.
W91-02638 7C

Water Resources Data for Texas, Water Year 1989. Volume 2: San Jacinto River, Brazos River, San Bernard River Basins and Intervening Coastal Basins.
W91-02639 7C

Water Resources Data for Texas, Water Year 1989. Volume 3: Colorado River, Lavaca River, Guadalupe River, Nueces River, Rio Grande Basins and Intervening Coastal Basins.
W91-02640 7C

Water Resources Data for Washington, Water Year 1989.
W91-02641 7C

SURFACTANTS
Toxic Effects of Tetraethyl Lead and Its Derivatives on the Chrysophyte Poteriochromonas malhamensis: VIII. Comparative Studies with Surfactants.
W91-02432 5C

Acute Toxicity of Industrial Surfactants to Mysidopsis bahia.
W91-02445 5C

Elimination of Surfactants in Water Treatment by Adsorption onto Activated Carbon.
W91-02824 5F

Impact of Nitrogen on the Adsorptive Capacity of Activated Charcoal.
W91-02825 5F

SURVEYS
Importance of Geographical Aspects in Environmental Studies of Hydro-Quebec Reservoirs.
W91-02396 2H

Inventory and Monitoring of Forested-Wetland Resources of ASEAN.
W91-02476 2H

PC-Based Analytical Stereoplotter for Wetland Inventories: An Efficient and Economical Photogrammetric Instrument for Field Offices.
W91-02503 7B

Classification of Mangrove Forest by Using 1:40,000-Scale Aerial Photographs.
W91-02504 2H

Survey of Small Sewage Treatment Facilities in Ohio.
W91-02532 5D

Investigation of Rest Area Requirements: Appendix-Pertinent Rest Area Literature.
W91-02620 5D

Indicators of Ecosystem Recovery.
W91-02896 5G

SURVIVAL
Effects of pH, Aluminum, and Calcium on Survival and Growth of Eggs and Fry of Brook Trout (Salvelinus fontinalis).
W91-02103 5C

Survival of Striped Bass Larvae and Yearlings in Relation to Contaminants and Water Quality in the Upper Chesapeake Bay.
W91-02194 5C

SUSPENDED SEDIMENTS
Field Verification of 2-D and 3-D Suspended-Sediment Models.
W91-02527 2J

Type of Suspended Clay Influences Lake Productivity and Phytoplankton Community Response to Phosphorus Loading.
W91-02586 2H

Mississippi River-Gulf Outlet, Louisiana: Field Data Report.
W91-02604 2E

SUSPENDED SOLIDS
Investigation of the Coagulation Mechanism of the Suspended Particulate Matter in Coastal Waters.
W91-02083 2J

Mechanism of Enrichment of Trace Metals on Fine Sludges Collected from Filtration Plants.
W91-02819 5A

SUSPENSION
Effect of Charge Density and Molecular Mass of Cationic Polymers on Flocculation Kinetics in Aqueous Solution.
W91-02145 5F

SUSQUEHANNA RIVER
Continuous Seismic-Reflection Profiling of Glacial Drift along the Susquehanna, Chemung, and Chenango Rivers, South-Central New York and North-Central Pennsylvania.
W91-02285 7B

SVALBARD
Fast-Flowing Outlet Glaciers on Svalbard Ice Caps.
W91-02154 2C

SWAMPS
Flooding and Saltwater Intrusion: Potential Effects on Survival and Productivity of Wetland Forests Along the U.S. Gulf Coast.
W91-02489 4C

Cat Island Swamp: Window to a Fading Louisiana Ecology.
W91-02490 4C

Growth and Development of Bald-Cypress/Water-Tupelo Stands under Continuous Versus Seasonal Flooding.
W91-02499 2E

Comparative Study of the Response of Taxodium distichum and Nyssa aquatica Seedlings to Soil Anaerobiosis and Salinity.
W91-02500 2E

Long-Term Trends in the Bald-Cypress (Taxodium distichum) Resource in Louisiana (U.S.A).
W91-02501 2H

SWEDEN
Re-Examination of Seiche Periods of Lake Vattern.
W91-02593 2H

Modelling of the Evolution of Ground Waters in a Granite System at Low Temperature: The Stripa Ground Waters, Sweden.
W91-02893 2K

SWIMMING
Sewage Lagoon to Splendid Lakes.
W91-02425 5G

EC Bathing Waters Directive as Applied to Scotland.
W91-02848 5G

SWITZERLAND
Floods of 1987 in the Glacial Basins Situated in Pennine Alps in Switzerland (Les Crues de l'ete 1987 dans les Bassins Versants Glaciaires des Alps Pennines).
W91-02049 2E

Seasonal Delivery of the Particulate Forms of Phosphorus to Lake Geneva from the Upper Rhone River.
W91-02448 2H

Planktoneustonic Algae in the Surface Films of Lake Zurich: Occurrence and Dependence on Phytoplankton Succession.
W91-02451 2H

SYMPOSIUM
Indian Water Rights and Water Resources Management.
W91-02262 6E

Northeast Glacial Aquifers.
W91-02280 2F

State-of-the-Art of Hydrology and Hydrogeology in the Arid and Semi-Arid Areas of Africa.
W91-02288 2A

Groundwater Management: Quantity and Quality.
W91-02672 4B

SYSTEMS ANALYSIS
Simplified Optimisation Procedure for Fixed Bed Adsorption Systems.
W91-02081 5D

SYSTEMS ENGINEERING
Systems Engineering Approach to Solutions of Drought in Developing Countries: The Case of Tanzania.
W91-02361 2A

Bounded Implicit Enumeration for Wastewater-Treatment Systems.
W91-02574 5D

TAIWAN
Applied Land Classification for Surface Water Quality Management: I. Watershed Classification.
W91-02947 5G

Applied Land Classification for Surface Water Quality Management: II. Land Process Classification.
W91-02948 5G

TANZANIA
Influence of Continental Rifting on the Hydrogeology of the Bahi Drainage Basin, Dodoma Province, Central Tanzania.
W91-02342 2F

Systems Engineering Approach to Solutions of Drought in Developing Countries: The Case of Tanzania.
W91-02361 2A

TASTE
Key Factors in Taste and Odour Problems for Municipal Water Works Using Surface Water Sources.
W91-02394 5F

TAXES
Models for a Rational Utilization of High Quality Groundwater Resources.
W91-02715 3E

TAXONOMY
Planktoneustonic Algae in the Surface Films of Lake Zurich: Occurrence and Dependence on Phytoplankton Succession.
W91-02451 2H

Assessment of Bank Slope as a Predictor of Conservation Status in River Corridors.
W91-02516 2H

TECTONICS
Influence of Continental Rifting on the Hydrogeology of the Bahi Drainage Basin, Dodoma Province, Central Tanzania.
W91-02342 2F

Fan-Delta and Braid-Delta Systems in Pennsylvanian Sandia Formation, Taos Trough, Northern New Mexico: Depositional and Tectonic Implications.
W91-02519 2J

TELEMETRY
Utilization of the ARGOS System Within the Framework of the Hydrometric Network of Benin (L'Utilisation du Systeme ARGOS dans le Cadre du Reseau Hydrometrique Beninois).
W91-02340 7B

Teletransmission of Hydrological Data Within the Framework of the Programme to Combat Onchocerciasis (Teletransmission des Donnees Hydrologiques dans le Cadre du Programme de Lutte Contre l'Onchocercose).
W91-02353 7B

TEMPERATURE
Simplified Method to Estimate Regional 24-h Evapotranspiration from Thermal Infrared Data.
W91-02129 2D

TEMPERATURE EFFECTS
Phototaxis in Daphnia magna: The Influence of Temperature and Acidity on the Phototactic Behaviour of Daphnia Genotypes.
W91-02117 2H

Flow to a Heated Borehole in Porous, Thermoelastic Rock: Analysis.
W91-02185 2F

Effects of Environmental Parameters on the Elimination of Cadmium by Eastern Oysters, Crassostrea virginica.
W91-02198 5B

Field Study of the Effects of Water Temperature, Discharge and Trout Odour on the Drift of Stream Invertebrates.
W91-02454 2H

Activated Sludge Process: A Proposed Method to Predict Process Parameters.
W91-02791 5D

Bed Configurations in Steady Unidirectional Water Flows: Part I. Scale Model Study Using Fine Sands.
W91-02925 2E

Bed Configurations in Steady Unidirectional Water Flows: Part III. Effects of Temperature and Gravity.
W91-02927 2E

TEMPORAL DISTRIBUTION
Spatial Differences and Temporal Trends of Organochlorine Compounds in Biota from the Northwestern Hemisphere.
W91-02467 5B

TENNESSEE
Altitude of Potentiometric Surface, Fall 1985, and Historic Water-Level Changes in the Memphis Aquifer in Western Tennessee.
W91-02224 2F

Geology and Ground-Water Resources of the Cockfield Formation in Western Tennessee.
W91-02225 2F

Water-Quality, Well Construction, and Groundwater Level Data for an Investigation of Radionuclides in Ground Water, Hickman and Maury Counties, Tennessee.
W91-02238 2F

Altitude of Potentiometric Surface, Fall 1985, and Historic Water-Level Changes in the Fort Pillow Aquifer in Western Tennessee.
W91-02248 2F

Floods of February 1989 in Tennessee.
W91-02260 4A

TERATOGENIC EFFECTS
Selenium Teratogenesis in Natural Populations of Aquatic Birds in Central California.
W91-02206 5C

Chronic Toxicity of Copper to a Partial Life Cycle of the Midge, Chironomus decorus.
W91-02431 5C

Hydrogeologic Assessment of Exposure to Solvent-Contaminated Drinking Water: Pregnancy Outcomes in Relation to Exposure.
W91-02935 5C

TESTING PROCEDURES
Upgrading Procurement Specifications for Hydroelectric Machines.
W91-02158 8C

Removal and Fate of RCRA and CERCLA Toxic Organic Pollutants in Wastewater Treatment.
W91-02653 5D

Adaptation of a Lead-testing Program.
W91-02765 5A

TEXAS
Analysis of Water Surface and Flow Distribution for the Design Flood at a Proposed Highway Crossing of the Sabine River Near Tatum, Texas.
W91-02226 2

Freshwater Withdrawals in Texas, 1985.
W91-02228 7

Water Resources Data for Texas, Water Year 1989. Volume 2: San Jacinto River, Brazos River, San Bernard River Basins and Intervening Coastal Basins.
W91-02639 7

Water Resources Data for Texas, Water Year 1989. Volume 3: Colorado River, Lavaca River, Guadalupe River, Nueces River, Rio Grande Basins and Intervening Coastal Basins.
W91-02640 7

Hydrologic Hydrochemical Characterization of Texas Frio Formation Used for Deep-Well Injection of Chemical Wastes.
W91-02814 5

Pretest Analyses of Water Demand in Thirsty Communities.
W91-02855 6

TEXTILE MILL WASTES
North Carolina Plant Solves Textile-Wastewater Problems.
W91-02562 5D

THE NETHERLANDS
Changes in Seasonal Succession of Phytoplankton Induced by the Storm-Surge Barrier in the Oosterschelde (S.W. Netherlands).
W91-02116 2L

Threat to Groundwater Quality by Pesticides in The Netherlands.
W91-02688 5B

Model to Predict and Assess the Effects of Groundwater Withdrawal on the Vegetation in the Pleistocene Areas of The Netherlands.
W91-02949 6G

THERMAL ENERGY
Aquifer Thermal Energy Storage: A Numerical Simulation of Field Experiments in China.
W91-02866 4B

THERMAL RADIATION
Decontamination Technologies for Release from Bioprocessing Facilities: Part V. Decontamination of Sludge.
W91-02936 5D

THERMAL STRATIFICATION
Diel and Seasonal Energy Transfer, Storage and Stratification in African Reservoirs and Lakes.
W91-02370 2H

THERMOCOUPLES
Field Frost Heave Measurement and Prediction During Periods of Seasonal Frost.
W91-02150 2C

THIN LAYER CHROMATOGRAPHY
Sorption Layers Impregnated with Ammonium Molybdate for the Thin Layer Chromatography in Order to Evaluate Phenol Contaminated Waters (Ammoniummolybdatimpaegnierte Sorptionschichten fuer die Duennschichtchromatographie zur Beurteilung Phenolkontaminierter Waesser).
W91-02059 5A

THIOCARBAMATE PESTICIDES
S-Oxygenation of Thiobencarb (Bolero) in Hepatic Preparations from Striped Bass (Morone saxatilis) and Mammalian systems.
W91-02552 5C

THROUGHFALL
Precipitation, Throughfall, Soil Solution and Streamwater Chemistry in a Holm-Oak (Quercus ilex) Forest.
W91-02744 2K

THUNDERSTORMS
Some Characteristics of Point Discharge Current during Two Pre-Monsoon Season Thunderstorms at Pune.
W91-02553 2B

TIDAL EFFECTS
Tidal and Turbidity Effects on the Shallow-Water Fish Assemblage of Kuwait Bay.
W91-02126 2L

TIDAL FLOODS
Woody Plant Succession on Earthquake-Uplifted Coastal Wetlands of the Copper River Delta, Alaska.
W91-02498 2H

TIDAL HYDRAULICS
Some Observational Evidence on the Effect of Atmospheric Forcing on Tidal Variability in the Upper Delaware Bay.
W91-02833 2L

TIDE LANDS
Controls and Effects of Continental Brine Formation in a Supratidal Ephemeral Lake in the Semi-arid Environment of Spencer Gulf, South Australia.
W91-02806 2H

TIDES
Some Observational Evidence on the Effect of Atmospheric Forcing on Tidal Variability in the Upper Delaware Bay.
W91-02833 2L

TILL
Till Genesis and Hydrogeological Properties.
W91-02165 2F

Methods for Measuring the Saturated Hydraulic Conductivity of Tills.
W91-02166 7B

Saturated Hydraulic Conductivity of Scandinavian Tills.
W91-02167 2F

Saturated Hydraulic Conductivity of Clayey Tills and the Role of Fractures.
W91-02168 2F

Unsaturated Hydraulic Conductivity Determined by the Hot Air Method for Some Danish Till Soils.
W91-02169 2G

Methods Used for Calculation of Plant Available Water in Nordic Till Soils.
W91-02170 2G

TILLAGE
Coupled Water and Heat Transport in Ridged Soils.
W91-02133 2G

Macroporosity and Its Relation to Saturated Hydraulic Conductivity under Different Tillage Practices.
W91-02138 2G

TIME DOMAIN REFLECTOMETRY
Calibration of Time Domain Reflectometry for Water Content Measurement Using a Composite Dielectric Approach.
W91-02857 2G

Computer-Controlled 36-Channel Time Domain Reflectometry System for Monitoring Soil Water Contents.
W91-02861 2G

TIME SERIES ANALYSIS
Outliers in Groundwater Quality Time Series.
W91-02687 7C

Gamma-Autoregressive Models for Stream-Flow Simulation.
W91-02922 2E

TISSUE ANALYSIS
Toxicity of Chlorinated Bornane (Toxaphene) Residues Isolated from Great Lakes Lake Trout (Salvelinus namaycush).
W91-02435 5C

TOADS
Protective Action of Ions against Cadmium Toxicity to Young Bufo arenarum Tadpoles.
W91-02092 5C

TOGO
Design and Management of Rural Water Supply Projects: Lessons Learned from Comparative Study of USAID Projects in Burkina Faso and Togo.
W91-02362 5F

TOLUENE
Drinking Water Criteria Document for Toluene.
W91-02731 5G

TOPSOIL
Hydrological Response of Soil Surfaces to Rainfall as Affected by Cover and Position of Rock Fragments in the Top Layer.
W91-02812 2J

TOXAPHENES
Toxicity of Chlorinated Bornane (Toxaphene) Residues Isolated from Great Lakes Lake Trout (Salvelinus namaycush).
W91-02435 5C

Drinking Water Criteria Document for Toxaphene.
W91-02733 5G

TOXIC WASTES
Degradation of Pesticide Waste Taken from a Highly Contaminated Soil Evaporation Pit in California.
W91-02443 5G

Toxic-Substance Control for the Ohio River.
W91-02564 5G

Removal and Fate of RCRA and CERCLA Toxic Organic Pollutants in Wastewater Treatment.
W91-02653 5D

Diversion Capacity of Capillary Barriers.
W91-02887 5E

Hydrogeologic Assessment of Exposure to Solvent-Contaminated Drinking Water: Pregnancy Outcomes in Relation to Exposure.
W91-02935 5C

Impact of Distillery Effluent Application to Land on Soil Microflora.
W91-02946 5C

TOXICITY
Toxicity Test for Water and Waste Water: Aldehyde Dehydrogenase Inhibition Test in Cuvets and Microtiter Plates (Toxizitaetstests fuer Wasser und Abwasser: Kuevetten- und Mikrotiterplattentest mit Aldehyddehydrogenase).
W91-02056 5A

Toxicity Evaluation of the Proposed Secondary and the Primary Effluents Discharged to Massachusetts Bay.
W91-02101 5B

Inorganic Monomeric Aluminum and pH as Predictors of Acidic Water Toxicity to Brook Trout (Salvelinus fontinalis).
W91-02108 5C

Aluminum and Acid Toxicity to Two Strains of Brook Trout (Salvelinus fontinalis).
W91-02109 5C

Electron Microscopy Documenting the Cellular Metabolic Fate of Hg Ions.
W91-02171 5C

Electron Microscopy Documenting the Cellular Metabolic Fate of Zn Ions.
W91-02172 5C

Effects of Atrazine on Freshwater Microbial Communities.
W91-02202 5C

Methods for Assessing Fertilization and Embryonic/Larval Development in Toxicity Tests Using the California Mussel (Mytilus californianus).
W91-02212 5A

Population-Specific Toxicity Responses by the Freshwater Oligochaete, Stylodrilus heringianus, in Natural Lake Michigan Sediments.
W91-02213 5C

TOXICITY

Stage Specific Toxicity of 2,3,7,8-Tetrachlorodibenzo-p-Dioxin in Embryos of the Japanese Medaka (Oryzias latipes).
W91-02215 5C

Comparative Evaluation of Five Toxicity Tests with Sediments from San Francisco Bay and Tomales Bay, California.
W91-02218 5A

Acute Toxicity of Aqueous and Substrate-Bound Copper to the Midge, Chironomus decorus.
W91-02430 5C

Chronic Toxicity of Copper to a Partial Life Cycle of the Midge, Chironomus decorus.
W91-02431 5C

Toxic Effects of Tetraethyl Lead and Its Derivatives on the Chrysophyte Poteriochromonas malhamensis: VIII. Comparative Studies with Surfactants.
W91-02432 5C

Tributyltin Retards Regeneration and Produces Deformities of Limbs in the Fiddler Crab, Uca pugilator.
W91-02434 5C

Toxicity of Chlorinated Bornane (Toxaphene) Residues Isolated from Great Lakes Lake Trout (Salvelinus namaycush).
W91-02435 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: I. 1,2,4-Trichlorobenzene.
W91-02436 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: II. 1,3,5-Trichlorobenzene.
W91-02437 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: III. 1,2,3-Trichlorobenzene.
W91-02438 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: IV. Pentachlorobenzene and Comparison with Trichlorobenzene Isomers.
W91-02439 5C

Toxicity Test Procedures for Hyalella azteca, and Chronic Toxicity of Cadmium and Pentachlorophenol to H. azteca, Gammarus fasciatus, and Daphnia magna.
W91-02444 5A

Influence of Season and Exercise on the Lethal Toxicity of Cyanide to Rainbow Trout (Salmo gairdneri).
W91-02458 5C

Histopathology of Rainbow Trout Exposed to a Bleached Kraft Pulp Mill Effluent.
W91-02459 5C

Toxicity Testing of Sublethal Effects of Dredged Materials.
W91-02461 5C

Chronic Effects of 2,2'-dichlorobiphenyl on Reproduction, Mortality, Growth, and Respiration of Daphnia pulicaria.
W91-02466 5C

Subclinical Effects of Groundwater Contaminants. II. Alteration of Regional Brain Monoamine Neurotransmitters by Benzene in CD-1 Mice.
W91-02469 5C

Toxicological Risk/Benefit-Aspects of Drinking Water Chlorination and of Alternative Disinfection Procedures.
W91-02547 5F

Heavy Metals in Drinking Water: Standards, Sources, and Effects (Jan 78 - Sep 89). Citations from the Life Sciences Collection Database.
W91-02647 5F

Application of a Simple Short-Term Bioassay for the Identification of Genotoxins from Hazardous Wastes.
W91-02665 5A

Inhibitory Effect of Citrus unshu Peel on Anaerobic Digestion.
W91-02773 5D

Acute Toxicity of Heavy Metals to Aerobic Digestion of Waste Cheese Whey.
W91-02776 5D

Role of Resin Acids in the Anaerobic Toxicity of Chemithermomechanical Pulp Wastewater.
W91-02797 5D

TOXICOLOGY

Protective Action of Ions against Cadmium Toxicity to Young Bufo arenarum Tadpoles.
W91-02092 5C

Sublethal Effects of 2,2-Dichloropropionic Acid (Dalapon) on Fossaria cubensis, Intermediate Host of the Liver Fluke, Fasciola hepatica.
W91-02095 5C

Oxygen Uptake of Pseudosuccinea columella and Fossaria cubensis Treated with Sublethal Concentrations of CUTRINE-PLUS, an Algicide.
W91-02096 5C

Methylparathion-Induced Alterations in the Acetylcholinesterase and Phosphatases in a Penaeid Prawn, Metapenaeus monoceros.
W91-02097 5C

Toxicity Evaluation of the Proposed Secondary and the Primary Effluents Discharged to Massachusetts Bay.
W91-02101 5B

Electron Microscopy Documenting the Cellular Metabolic Fate of Hg Ions.
W91-02171 5C

Electron Microscopy Documenting the Cellular Metabolic Fate of Zn Ions.
W91-02172 5C

Environmental Chemistry and Biological Effects of Cadmium Compounds.
W91-02173 5B

EXAMS 2: Exposure Analysis Modeling System.
W91-02174 7B

Short-Term Exposure of Zooplankton to the Synthetic Pyrethroid, Fenvalerate, and Its Effects on Rates of Filtration and Assimilation of the Alga, Chlamydomonas reinhardii.
W91-02195 5C

Changes in Plasma, Liver, and Ovary Vitellogenin in Landlocked Atlantic Salmon Following Exposure to Sublethal Cyanide.
W91-02196 5C

Effects of Environmental Parameters on the Elimination of Cadmium by Eastern Oysters, Crassostrea virginica.
W91-02198 5B

Short-Term Lethality and Sediment Avoidance Assays with Endrin-Contaminated Sediment and Two Oligochaetes from Lake Michigan.
W91-02199 5C

Artificially Induced Metamorphosis Acetone i
Acris gryllus.
W91-02201 5C

Effects of Atrazine on Freshwater Microbia
Communities.
W91-02202 5C

Responses of Zooplankton and Chaoborus t
Temephos in a Natural Pond and in the Labora
tory.
W91-02203 5C

Assessing Detoxification of a Complex Hazard
ous Waste, Using the Microtox Bioassay.
W91-02204 5

Calcium Metabolism in Two Populations of th
Snail Helix aspersa on a High Lead Diet.
W91-02205 5

Weathered Crude Oil Effects on Chicks of For
Tailed Storm-Petrels (Oceanodroma furcata).
W91-02207 5

Methods for Assessing Fertilization and Embr
onic/Larval Development in Toxicity Tes
Using the California Mussel (Mytilus califo
nianus).
W91-02212 5

Population-Specific Toxicity Responses by t
Freshwater Oligochaete, Stylodrilus her
gianus, in Natural Lake Michigan Sedimen
W91-02213 5

Avoidance of Selenium-Treated Food by M
lards.
W91-02214

Stage Specific Toxicity of 2,3,7,8-Tetrachloro
benzo-p-Dioxin in Embryos of the Japan
Medaka (Oryzias latipes).
W91-02215

Toxicity of Inorganic and Organic Selenium
Daphnia magna (Cladocera) and Chironomus
parus (Diptera).
W91-02216

Rainbow Trout Liver Activation Systems w
the Ames Mutagenicity Test.
W91-02217

Comparative Evaluation of Five Toxicity T
with Sediments from San Francisco Bay
Tomales Bay, California.
W91-02218

Acute Toxicity of Aqueous and Substrate-Bo
Copper to the Midge, Chironomus decorus.
W91-02430

Toxic Effects of Tetraethyl Lead and Its Der
tives on the Chrysophyte Poteriochromo
malhamensis: VIII. Comparative Studies
Surfactants.
W91-02432

Tributyltin Retards Regeneration and Prod
Deformities of Limbs in the Fiddler Crab,
pugilator.
W91-02434

Toxicity of Chlorinated Bornane (Toxaph
Residues Isolated from Great Lakes Lake T
(Salvelinus namaycush).
W91-02435

Effects of Chlorinated Benzenes on Di
Fatty Acid Composition and Quantitative
phology: I. 1,2,4-Trichlorobenzene.
W91-02436

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: II. 1,3,5-Trichlorobenzene.
W91-02437 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: III. 1,2,3-Trichlorobenzene.
W91-02438 5C

Effects of Chlorinated Benzenes on Diatom Fatty Acid Composition and Quantitative Morphology: IV. Pentachlorobenzene and Comparison with Trichlorobenzene Isomers.
W91-02439 5C

Toxicity Test Procedures for Hyalella azteca, and Chronic Toxicity of Cadmium and Pentachlorophenol to H. azteca, Gammarus fasciatus, and Daphnia magna.
W91-02444 5A

Acute Toxicity of Industrial Surfactants to Mysidopsis bahia.
W91-02445 5C

RACE ELEMENTS
Trace Element Accumulation in the Tissue of Fish from Lakes with Different pH Values.
W91-02084 5B

RACE METALS
Trace Metal Analysis of Sewage Sludge and Soils in Bahrain.
W91-02088 5E

Effect of Solid-Phase Speciation on Metal Mobility and Phytoavailability in Sludge-Amended Soil.
W91-02089 5E

Trace Metals in the Western Mediterranean Sea.
W91-02179 5B

Trace Metals in the Severn Estuary: A Reappraisal.
W91-02557 5B

Quantitative Assessment of the Sources and General Dynamics of Trace Metals in a Soft-Water Lake.
W91-02587 5B

Mechanism of Enrichment of Trace Metals on Fine Sludges Collected from Filtration Plants.
W91-02819 5A

ACERS
Glacial Mass Balance Determination in the Accumulation Zone by In situ Measurements of Tchernobyl Radioactivity (Determination du Bilan Glaciaire en Zone d'Accumulation par Mesure In Situ de la Radioactivite due a Tchernobyl).
W91-02052 2C

Tritium, Oxygen-18, and Deuterium Diffusion at the Confederation Road Landfill Site, Sarnia, Ontario, Canada.
W91-02146 5B

Three-Dimensional Statistical Moment Analysis of the Stanford/Waterloo Borden Tracer Data.
W91-02182 5B

Investigation of Groundwater Recharge Mechanisms in Burkina Faso.
W91-02320 2F

Prospecting for Aquifer Fractures in the Crystalline Basement by Soil Radon Analysis (Prospection des Fractures Aquiferes du Socle Cristallin par Dosage du Gaz Radon Contenu dans le Sol).
W91-02324 2F

Study of Piezometric Depressions by Environmental Isotopes: First Data on Examples in Mali (Etude des Depressions Piezometriques par les Isotopes de l'Environnement: Premieres Donnees sur des Exemples au Mali).
W91-02343 2F

Correlation of Erosion Measurements and Soil Caesium-137 Content.
W91-02913 2J

TRAINING
Advances Towards Water Resources Development Through Hydrological Training and Education.
W91-02293 6E

TRANSMISSIVITY
Evaluation of Hydrogeological Parameters in Heterogeneous Porous Media.
W91-02673 2F

Estimation of the Transmissivity of the Santiago Aquifer, Chile, Using Different Geostatistical Methods.
W91-02679 2F

TREEHOLES
Ecology of Water-Filled Treeholes in Australian Rainforests: Food Web Reassembly as a Measure of Community Recovery after Disturbance.
W91-02514 2H

TREND ANALYSIS
Identification of Large-Scale Spatial Trends in Hydrologic Data.
W91-02870 7C

TRI-N-BUTYLTIN CHLORIDE
Differences Between Freshwater and Seawater-Acclimated Guppies in the Accumulation and Excretion of Tri-n-Butyltin Chloride and Triphenyltin Chloride.
W91-02793 5C

TRIAZINE HERBICIDES
Enzyme-Linked Immunosorbent Assay Compared with Gas Chromatography/Mass Spectrometry for the Determination of Triazine Herbicides in Water.
W91-02192 5A

TRIAZINES
Enzyme-Linked Immunosorbent Assay Compared with Gas Chromatography/Mass Spectrometry for the Determination of Triazine Herbicides in Water.
W91-02192 5A

TRIBUTYLTIN FLUORIDE
Sublethal and Histopathological Effects of Trace Levels of Tributyltin Fluoride on Adult Oysters Crassostrea gigas.
W91-02045 5C

TRICKLING FILTERS
Fast Determination of the Biodegrability of Organic Compounds in a Laboratory-Trickling-Filter (Rasche Bestimmung des Bioabbaus Organischer Stoffe in einem Labor-Tropfkorper).
W91-02544 5D

TRIHALOMETHANES
Total Trihalomethane Formation During Targeted and Conventional Chlorination of Seawater for Biofouling Control.
W91-02538 5F

TRIPHENYLTIN CHLORIDE
Differences Between Freshwater and Seawater-Acclimated Guppies in the Accumulation and Excretion of Tri-n-Butyltin Chloride and Triphenyltin Chloride.
W91-02793 5C

TRITIUM
Tritium, Oxygen-18, and Deuterium Diffusion at the Confederation Road Landfill Site, Sarnia, Ontario, Canada.
W91-02146 5B

TROPHIC LEVEL
Pelagic Calcite Precipitation and Trophic State of Hardwater Lakes.
W91-02377 2H

Classification of Some Reservoirs in SR Serbia (SFR Yugoslavia) Based on Analysis of Plankton Species as Indicators of Trophic Conditions.
W91-02388 2H

Ecology of Lowland Zegrzynski Reservoir near Warsaw.
W91-02389 2H

TROPICAL REGIONS
Tropical Squall Line Observed During the COPT 81 Experiment in West Africa. Part III: Heat and Moisture Budgets.
W91-02761 2B

TROUT
Lake Acidification and Fisheries Project: Brook Trout (Salvelinus fontinalis) Early Life Stages.
W91-02102 5C

Effects of pH, Aluminum, and Calcium on Survival and Growth of Eggs and Fry of Brook Trout (Salvelinus fontinalis).
W91-02103 5C

Effects of Water Acidity, Calcium, and Aluminum on Whole Body Ions of Brook Trout (Salvelinus fontinalis) Continuously Exposed from Fertilization to Swim-Up: A Study by Instrumental Neutron Activation Analysis.
W91-02104 5C

Whole Body Ions of Brook Trout (Salvelinus fontinalis) Alevins: Responses of Yolk-Sac and Swim-Up Stages to Water Acidity, Calcium, and Aluminum, and Recovery Effects.
W91-02105 5C

Epidermal Response to pH, Aluminum, and Calcium Exposure in Brook Trout (Salvelinus fontinalis) Fry.
W91-02106 5C

Responses of Brook Trout (Salvelinus fontinalis) Fry to Fluctuating Acid, Aluminum, and Low Calcium Exposure.
W91-02107 5C

Inorganic Monomeric Aluminum and pH as Predictors of Acidic Water Toxicity to Brook Trout (Salvelinus fontinalis).
W91-02108 5C

Aluminum and Acid Toxicity to Two Strains of Brook Trout (Salvelinus fontinalis).
W91-02109 5C

Rainbow Trout Liver Activation Systems with the Ames Mutagenicity Test.
W91-02217 5A

Toxicity of Chlorinated Bornane (Toxaphene) Residues Isolated from Great Lakes Lake Trout (Salvelinus namaycush).
W91-02435 5C

Influence of Season and Exercise on the Lethal Toxicity of Cyanide to Rainbow Trout (Salmo gairdneri).
W91-02458 5C

Histopathology of Rainbow Trout Exposed to a Bleached Kraft Pulp Mill Effluent.
W91-02459 5C

Accumulation from Water and Depuration of 110mAg by a Freshwater Fish, Salmo trutta L.
W91-02798 5B

TRUCKEE RIVER BASIN
Water Transfers and Paper Rights in the Truckee and Carson River Basins.
W91-02266 6E

TUFF
Modeling the Mass-Transfer Rate of Radioactive Cobalt from a Synthetic Groundwater to Volcanic Tuff Media.
W91-02163 5B

TUNISIA
Some Examples of Important Problems Connected to Rainfall-Runoff Modelling in Semi-Arid Zone.
W91-02308 7C

TUPELO TREES
Growth and Development of Bald-Cypress/Water-Tupelo Stands under Continuous Versus Seasonal Flooding.
W91-02499 2E

TURBIDITY
Modelling Phytoplankton Productivity in Turbid Waters with Small Euphotic to Mixing Depth Ratios.
W91-02115 2H

Tidal and Turbidity Effects on the Shallow-Water Fish Assemblage of Kuwait Bay.
W91-02126 2L

Filtration/Adsorption Media for Bacteria and Turbidity Removal.
W91-02579 5F

TURBINES
Soviet Design of Large Turbines for Wide Head Ranges.
W91-02155 8C

New Approach to Turbine Speed.
W91-02156 8C

Behaviour of Francis Units Under Partial Loads.
W91-02157 8C

Upgrading Procurement Specifications for Hydroelectric Machines.
W91-02158 8C

Turbine-Intake Fish-Diversion System.
W91-02915 8I

TURBULENT FLOW
Turbulent Flow Theory for African Regoliths.
W91-02344 2F

Turbulent Shear Stress in Heterogeneous Sediment-Laden Flows.
W91-02923 2J

TURKEY
Development of Turkey's Electric Energy.
W91-02110 8C

UCAYALI RIVER
Geographical Aspects of Forested Wetlands in the Lower Ucayali, Peruvian Amazonia.
W91-02481 2H

UCAYALI RIVER BASIN
Fluvial Dynamics and Succession in the Lower Ucayali River Basin, Peruvian Amazonia.
W91-02480 2E

ULTRAVIOLET RADIATION
Inactivation of Bacteriophage MS2 in Wastewater Effluent with Monochromatic and Polychromatic Ultraviolet Light.
W91-02795 5D

UNCERTAINTY
Reliability Estimation in Modeling Watershed Runoff with Uncertainties.
W91-02858 2E

Uncertainty Propagation with Numerical Models for Flow and Transport in the Unsaturated Zone.
W91-02875 2G

UNCONFINED AQUIFERS
Response of the Water Level in a Well to Earth Tides and Atmospheric Loading Under Unconfined Conditions.
W91-02188 2F

UNDERGROUND STORAGE
Containment of Organic Leachates from Leaking Underground Storage Tanks Using Tailored Soils as Liners.
W91-02648 5G

UNDERGROUND WASTE DISPOSAL
Gas Migration in Discrete Fracture Networks.
W91-02871 5E

UNGAGED STREAMS
Predetermination of Floods in Small Sahelian Basins under 10 Square Kilometers (La Predeterminatione des Crues sur des Petits Bassins Saheliens Inferieurs a 10 km2).
W91-02305 2E

UNIT HYDROGRAPHS
Unit Hydrograph Technique Applied to Sahelian Flood Modeling: Comparison of Different Identification Methods (L'Hydrogramme Unitaire Applique a l'Analyse des Crues au Sahel: Comparaison de Differentes Methodes d'Identification).
W91-02309 2E

Incorporating Hillslope Effects into the Geomorphologic Instantaneous Unit Hydrograph.
W91-02868 2E

UNSATURATED FLOW
Unsaturated Hydraulic Conductivity Determined by the Hot Air Method for Some Danish Till Soils.
W91-02169 2G

Solution of a Nonlinear Absorption Model of Mixed Saturated-Unsaturated Flow.
W91-02872 2G

Immobile Water During Solute Transport in Unsaturated Sand Columns.
W91-02876 2G

UNSATURATED ZONE
Uncertainty Propagation with Numerical Models for Flow and Transport in the Unsaturated Zone.
W91-02875 2G

UNSTEADY FLOW
Mass-Conserving Method of Characteristics for Streamflow Modeling.
W91-02234 2E

Energy Relations in Transient Closed-Conduit Flow.
W91-02522 8B

Apparent Dispersion in Transient Groundwater Flow.
W91-02864 2F

UPGRADING
From Zero to 20 MGD in Ten Months.
W91-02422 5F

URANIUM
Superfund Record of Decision: United Nuclear Corporation, NM. First Remedial Action.
W91-02661 5G

URANIUM RADIOISOTOPES
Effect of Uranium Mine Tailings on Radionuclide Concentrations in Langley Bay, Saskatchewan, Canada.
W91-02460 5B

URBAN
Impacts of Urban Waste on Surface Water
Ouagadougou and Bobo-Dioulasso (Burkin
Faso) (Impacts des Rejets Urbains sur les Eau
de Surface a Ouagadougou et Bob-Dioulass
(Burkina Faso)).
W91-02369 5

URBAN AREAS
Free Ammonia and Toxicity Criteria in a Pollu
ed Urban Lake.
W91-02536 5

Health Effects of Chemical Waste in an Urba
Community.
W91-02952 5

URBAN DRAINAGE
New Approach for Optimization of Urba
Drainage Systems.
W91-02575 5

URBAN HYDROLOGY
Flood Dynamics of a Concrete-lined, Urba
Stream in Kansas City, Missouri.
W91-02809 4

URBAN RUNOFF
New Approach for Optimization of Urba
Drainage Systems.
W91-02575 5

URBANIZATION
Possible Effects of Residential Development
Streamflow, Riparian Plant Communities, a
Fisheries on Small Mountain Streams in Centr
Arizona.
W91-02493 4

Nutrients, Heavy Metals and Organic Micropo
lutants in an Eutrophic Brazilian Lagoon.
W91-02555 5

USSR
Soviet Design of Large Turbines for Wide Hea
Ranges.
W91-02155 8

UTAH
Water Resources Data for Utah, Water Ye
1989.
W91-02241 7

Water Resources Data for Washington, Wat
Year 1989.
W91-02641 7

UTILITIES
Potential for Expert Systems in Water Utili
Operation and Management.
W91-02415 5

VARIED FLOW
Experimental Investigation of Variable Densi
Flow and Mixing in Homogeneous and Heter
geneous Media.
W91-02862 2

VEGETATION
Geographical Aspects of Forested Wetlands
the Lower Ucayali, Peruvian Amazonia.
W91-02481 2

Vegetation Change on the Ouse Washes We
land, England, 1972-1988 and Effects on The
Conservation Importance.
W91-02515 2

Using Satellite Data for Mapping and Monito
ing Vegetation Resources.
W91-02599 7

VEGETATION EFFECTS
Effects of Vegetation Type on the Biogeoch
mistry of Small Catchments (Mont Lozer
France).
W91-02742 2

Width and Depth of Self-Formed Straight Gravel Rivers with Bank Vegetation.
W91-02865 2E

ENEZUELA
Venezuelan Floodplain Study on the Orinoco River.
W91-02478 2H

ENICE LAGOON
Influence of Waste Waters from the City of Venice and the Hinterland on the Eutrophication of the Lagoon.
W91-02930 5C

ERMONT
Regional Sludge Management Planning in Vermont.
W91-02954 5E

ERTICAL DISTRIBUTION
Reciprocal Diel Vertical Migration Behavior in Planktivores and Zooplankton in British Columbia Lakes.
W91-02067 2H

IBRIO
Pathogenic Marine Vibrio Species in Selected Nova Scotian Recreational Coastal Waters.
W91-02780 5B

LLEFRANCHE-SUR-MER
Monthly Variations of Dissolved Free Amino Acids (DFAA) Observed in the Bay of Villefranche-sur-Mer, France: Experimental Study on Their Uptake by Paracentrotus lividus and Sphaerechinus granularis Larvae (Variations Mensuelles des Acides Amines Libres Dissous (AALD) Presents en un Point de la rade de Villefranche-sur-Mer: Utilisation par les Larves de Paracentrotus lividus et de Sphaerechinus granularis).
W91-02047 2L

NYL ACETATE
Degradation of Vinyl Acetate by Soil, Sewage, Sludge, and the Newly Isolated Aerobic Bacterium V2.
W91-02769 5D

RGIN ISLANDS (US)
Water Resources Data for Puerto Rico and the U.S. Virgin Islands, Water Year 1989.
W91-02636 7C

RGINIA
Superfund Record of Decision: Avtex Fibers, VA. First Remedial Action.
W91-02656 5G

Two Decades of Progress.
W91-02957 5G

USES
Inactivation of Bacteriophage MS2 in Wastewater Effluent with Monochromatic and Polychromatic Ultraviolet Light.
W91-02795 5D

LATILE ORGANIC COMPOUNDS
Comparison of Quarter-Hourly On-Line Dynamic Headspace Analysis to Purge-and-Trap Analysis of Varying Volatile Organic Compounds in Drinking Water Sources.
W91-02219 5A

Groundwater Monitoring: Volatile Organic Chemicals Beneath Unsewered Subdivision.
W91-02413 5B

Drinking Water Contamination and the Incidence of Leukemia: An Ecologic Study.
W91-02509 5C

Superfund Record of Decision: Middletown Air Field, PA.
W91-02669 5G

Numerical Model for Simulating the In-situ Volatilization of Hydrocarbon Contaminants in Soils.
W91-02705 5B

VOLATILIZATION
Numerical Model for Simulating the In-situ Volatilization of Hydrocarbon Contaminants in Soils.
W91-02705 5B

VORTICES
Controlling Mechanism of Local Scouring.
W91-02523 2J

VOSGES MOUNTAINS
Influence of Acid Atmospheric Inputs on Surface Water Chemistry and Mineral Fluxes in a Declining Spruce Stand Within a Small Catchment (Vosges Massif, France).
W91-02741 5B

WALES
Limitations to the Understanding of Ion-Exchange and Solubility Controls for Acidic Welsh, Scottish, and Norwegian Sites.
W91-02735 5C

Hydrogeochemical Variations in Hafren Forest Stream Waters, Mid-Wales.
W91-02745 4C

Preliminary Analysis of Water and Solute Movement Beneath a Coniferous Hillslope in Mid-Wales, U. K.
W91-02746 2E

Hydrograph Separation Using Chemical Techniques: An Application to Catchments in Mid-Wales.
W91-02755 2K

Regional Model of Acidification in Wales.
W91-02759 5B

WASHINGTON
Water-Quality Characteristics of the Columbia Plateau Regional Aquifer System in Parts of Washington, Oregon, and Idaho.
W91-02223 2F

Hydrology of Goat Lake Watershed, Snohomish County, Washington, 1982-87.
W91-02227 5B

Selected Ground-Water Information for the Pasco Basin and Adjacent Areas, Washington, 1986-1989.
W91-02233 2F

Streamside Management Units in the Pacific Northwest.
W91-02497 6B

Superfund Record of Decision: Commencement Bay/Near Shore, WA. First Remedial Action.
W91-02659 5G

WASTE DISPOSAL
Hydrogeochemical Processes Controlling the Transport of Dissolved Organic Carbon Through a Forested Hillslope.
W91-02159 5B

Ecology of a Southern Ohio Stream Receiving Fly Ash Pond Discharge: Changes from Acid Mine Drainage Conditions.
W91-02208 5C

Siting Considerations for Resource Recovery Facilities.
W91-02421 5E

Degradation of Pesticide Waste Taken from a Highly Contaminated Soil Evaporation Pit in California.
W91-02443 5G

Estimation of Flow through and over Armored Slopes.
W91-02526 5E

Guidelines for Physical and Biological Monitoring of Aquatic Dredged Material Disposal Sites.
W91-02607 5A

Evaluation of Loading and Dredged Material Overflow from Mechanically Filled Hopper Barges in Mobile Bay, Alabama.
W91-02609 5E

Assessment of Ocean Waste Disposal. Task 5. Human Health Impacts of Waste Constituents. II. Pathogens and Antibiotic-and Heavy Metal-Resistant Bacteria.
W91-02616 5E

Acute Toxicity of Heavy Metals to Aerobic Digestion of Waste Cheese Whey.
W91-02776 5D

Sludge Disposal Strategy for Dumfries and Galloway Regional Council.
W91-02850 5E

European Environmental Directives--Implications for Northern Ireland.
W91-02851 5G

Diversion Capacity of Capillary Barriers.
W91-02887 5E

Laboratory Investigation of Beach Profiles in Tailings Disposal.
W91-02919 5E

WASTE DISPOSAL WELLS
Hydrologic Hydrochemical Characterization of Texas Frio Formation Used for Deep-Well Injection of Chemical Wastes.
W91-02814 5B

WASTE MANAGEMENT
Energy-Efficient Municipal Sludge Incineration.
W91-02563 5E

Laboratory Investigation of Beach Profiles in Tailings Disposal.
W91-02919 5E

WASTE RECOVERY
Recovery of Mineral Salts and Potable Water from Desalting Plant Effluents by Evaporation. Part II. Proposed Simulation System for Salt Recovery.
W91-02402 3A

Hazardous Waste Minimization: Source Reduction Alternatives in the Aerospace Industry.
W91-02411 5D

Siting Considerations for Resource Recovery Facilities.
W91-02421 5E

WASTE REDUCTION
Hazardous Waste Minimization: Source Reduction Alternatives in the Aerospace Industry.
W91-02411 5D

WASTE TREATMENT
Assessing Detoxification of a Complex Hazardous Waste, Using the Microtox Bioassay.
W91-02204 5E

Hazardous Waste Minimization: Source Reduction Alternatives in the Aerospace Industry.
W91-02411 5D

Batch Biodegradation of Industrial Organic Compounds Using Mixed Liquor from Different POTWs.
W91-02540 5D

WASTE TREATMENT

Performances of Digesters Treating the Organic Fraction of Municipal Solid Wastes Differently Sorted.
W91-02775 5D

Acute Toxicity of Heavy Metals to Aerobic Digestion of Waste Cheese Whey.
W91-02776 5D

WASTEWATER

Ozonation of o-Cresol in Aqueous Solutions.
W91-02783 5D

WASTEWATER ANALYSIS

Toxicity Test for Water and Waste Water: Aldehyde Dehydrogenase Inhibition Test in Cuvets and Microtiter Plates (Toxizitaetstests fuer Wasser und Abwasser: Kuevetten- und Mikrotiterplattentest mit Aldehyddehydrogenase).
W91-02056 5A

Determination of Trace Amounts of Acetaldehyde Using a Novel Chemiluminescence Reaction.
W91-02549 7B

Commitment to Monitoring and Sampling.
W91-02763 5D

Periphyton Ash Weight Estimation from Residue Not Digested after Hach Method of Kjeldahl Protein Nitrogen Analysis.
W91-02785 7B

Polychlorinated Biphenyls Partitioning in Waters from River, Filtration Plant and Wastewater Plant: The Case for Paris (France).
W91-02786 5B

Simple Method to Distinguish Between Polyphosphate and Other Phosphate Fractions of Activated Sludge.
W91-02790 5D

WASTEWATER DISPOSAL

Toxicity Evaluation of the Proposed Secondary and the Primary Effluents Discharged to Massachusetts Bay.
W91-02101 5B

Guidelines and Integrated Measures for Public Health Protection in Agricultural Reuse Systems.
W91-02142 5E

EC Bathing Waters Directive as Applied to Scotland.
W91-02848 5G

Low-Tech, Low-Cost Solution to Treatment in St. Ignace, Mich.
W91-02953 5D

WASTEWATER FACILITIES

Thermophilic Campylobacters in Two Sewage Treatment Plants in Libya.
W91-02122 5D

Survey of Small Sewage Treatment Facilities in Ohio.
W91-02532 5D

Operational Water Quality Management: Control of Storm Sewage at a Wastewater Treatment Plant.
W91-02541 5D

North Carolina Plant Solves Textile-Wastewater Problems.
W91-02562 5D

Using Programmable Logic Controllers.
W91-02566 5D

Commitment to Monitoring and Sampling.
W91-02763 5D

Digester Gas is Alternate Fuel.
W91-02764 5D

Activated Sludge Process: A Proposed Method to Predict Process Parameters.
W91-02791 5D

Low-Tech, Low-Cost Solution to Treatment in St. Ignace, Mich.
W91-02953 5D

Siting and Technology Pose Challenges for Communities Ending Ocean Disposal of Sludge.
W91-02955 5D

Two Decades of Progress.
W91-02957 5G

Carbon Columns vs. the PACT Process for Priority-Pollutant Removal.
W91-02958 5D

WASTEWATER FARMING

Guidelines and Integrated Measures for Public Health Protection in Agricultural Reuse Systems.
W91-02142 5E

WASTEWATER IRRIGATION

Guidelines and Integrated Measures for Public Health Protection in Agricultural Reuse Systems.
W91-02142 5E

WASTEWATER LAGOONS

Sewage Lagoon to Splendid Lakes.
W91-02425 5G

WASTEWATER MANAGEMENT

Survey of Small Sewage Treatment Facilities in Ohio.
W91-02532 5D

Operational Water Quality Management: Control of Storm Sewage at a Wastewater Treatment Plant.
W91-02541 5D

Fluid Behavior/Waste Management in Low-Gravity Environments.
W91-02565 5D

Freezing of Water and Wastewater Sludges.
W91-02571 5D

Investigation of Rest Area Requirements: Appendix-Pertinent Rest Area Literature.
W91-02620 5D

Commitment to Monitoring and Sampling.
W91-02763 5D

WASTEWATER POLLUTION

Vulnerability of the Brazzaville Aquifer and the Risk of Contamination with Domestic Wastes (Problemes de Vulnerabilite de la Nappe de Brazzaville et Risques de Contamination par les Rejets Domestiques).
W91-02339 5B

Impacts of Urban Waste on Surface Water in Ouagadougou and Bobo-Dioulasso (Burkina Faso) (Impacts des Rejets Urbains sur les Eaux de Surface a Ouagadougou et Bob-Dioulasso (Burkina Faso)).
W91-02369 5B

Assessment of Ocean Waste Disposal. Task 5. Human Health Impacts of Waste Constituents. II. Pathogens and Antibiotic-and Heavy Metal-Resistant Bacteria.
W91-02616 5E

Influence of Waste Waters from the City of Venice and the Hinterland on the Eutrophication of the Lagoon.
W91-02930 5C

WASTEWATER REACTORS

Denitrification by an Expanded Bed Biofilm Reactor.
W91-02539 5D

Simple Solutions for Steady-State Biofilm Reactors.
W91-02569 5D

Some Observations on Organic Removal in an SBR.
W91-02774 5D

Electrolytic Decomposition of Cyanide Effluent with an Electrochemical Reactor Packed with Stainless Steel Fiber.
W91-02784 5D

Kinetic Study on Methanogenesis by Attached Biomass in a Fluidized Bed.
W91-02792 5D

WASTEWATER RENOVATION

Fluid Behavior/Waste Management in Low-Gravity Environments.
W91-02565 5D

Waste Water, Infiltration-Percolation for Aquifer Recharge or Water Re-use.
W91-02710 5D

WASTEWATER TREATMENT

Biodegradability of Mono- and Disubstituted Benzene-Derivatives (Zur Biologischen Abbaubarkeit Mono- und Disubstituierter Benzolderivate).
W91-02055 5D

Simplified Optimisation Procedure for Fixed Bed Adsorption Systems.
W91-02081 5D

Laboratory Mesocosm Studies of Fe, Al, Mn Ca, and Mg Dynamics in Wetlands Exposed to Synthetic Acid Coal Mine Drainage.
W91-02091 5D

Toxicity Evaluation of the Proposed Secondary and the Primary Effluents Discharged to Massachusetts Bay.
W91-02101 5

Thermophilic Campylobacters in Two Sewage Treatment Plants in Libya.
W91-02122 5D

Selective Adsorption of Arsenic(V) Ion by Use of Iron(III) Hydroxide-Loaded Coral Limestone.
W91-02220 5

Heavy Metal Distribution in Anaerobic Sludge

Cat Island Swamp: Window to a Fading Louisiana Ecology.
W91-02490 4C

SOUTHERN UNIV., BATON ROUGE, LA. DEPT. OF BIOLOGICAL SCIENCES.
Sublethal Effects of 2,2-Dichloropropionic Acid (Dalapon) on Fossaria cubensis, Intermediate Host of the Liver Fluke, Fasciola hepatica.
W91-02095 5C

Oxygen Uptake of Pseudosuccinea columella and Fossaria cubensis Treated with Sublethal Concentrations of CUTRINE-PLUS, an Algicide.
W91-02096 5C

SOUTHWESTERN ILLINOIS METROPOLITAN AND REGIONAL PLANNING COMMISSION, COLLINSVILLE.
Volunteer Lake Monitoring Program, 1988. Volume VI: Southwestern Illinois Region.
W91-02618 7B

SPRINGBORN LABS., INC., WAREHAM, MA.
Toxicity Evaluation of the Proposed Secondary and the Primary Effluents Discharged to Massachusetts Bay.
W91-02101 5B

SRI VENKATESWARA UNIV., KAVALI (INDIA). DIV. OF TOXICOLOGY.
Methylparathion-Induced Alterations in the Acetylcholinesterase and Phosphatases in a Penaeid Prawn, Metapenaeus monoceros.
W91-02097 5C

STANFORD UNIV., CA. DEPT. OF APPLIED EARTH SCIENCES.
Indicator Conditional Simulation of the Architecture of Hydraulic Conductivity Fields: Application to a Sand-Shale Sequence.
W91-02676 2F

Optimal Groundwater Quality Management under Uncertainty: Incorporating the Effects of Spatial Variability of Hydraulic Conductivity.
W91-02708 5G

STANFORD UNIV., CA. DEPT. OF CIVIL ENGINEERING.
In-Situ Aquifer Restoration of Chlorinated Aliphatics by Methanotrophic Bacteria.
W91-02650 5G

STATE HYDRAULIC WORKS, ANKARA (TURKEY).
Development of Turkey's Electric Energy.
W91-02110 8C

STATE UNIV. OF NEW YORK AT SYRACUSE. COLL. OF ENVIRONMENTAL SCIENCE AND FORESTRY.
Structure of an Anhydride Related to a Mutagenic Component of Drinking Water, 3-Chloro-4-(dichloromethyl)-5-hydroxy-2(5H)-furanone.
W91-02551 5A

STATENS LIVSMEDELSVERK, UPPSALA (SWEDEN). FOOD RESEARCH DEPT.
Spatial Differences and Temporal Trends of Organochlorine Compounds in Biota from the Northwestern Hemisphere.
W91-02467 5B

STV, INC., POTTSTOWN, PA.
Siting Considerations for Resource Recovery Facilities.
W91-02421 5E

SUNDERLAND POLYTECHNIC (ENGLAND). SCHOOL OF BIOLOGY.
Lead, Zinc, Cadmium, and Fluoride in Small Mammals from Contaminated Grassland Established on Fluorospar Tailings.
W91-02082 5B

SVERIGES GEOLOGISKA A.B., GOETEBORG (SWEDEN).
Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 1. Estimation of Recharge.
W91-02332 2F

Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 3. Estimation of Resources.
W91-02334 2F

SVERIGES GEOLOGISKA A.B., LULEA (SWEDEN).
Groundwater Resources in a Poorly Transmissive Sandstone in a Semi-Arid Environment: 2. Regional Investigation of Geological Structures.
W91-02333 7B

SVERIGES LANTBRUKSUNIVERSITET, UMEA. DEPT. OF FOREST SITE RESEARCH.
Origins of Acid Runoff in a Hillslope During Storm Events.
W91-02737 5C

SVERIGES LANTBRUKSUNIVERSITET, UPPSALA. INSTITUTIONEN FOER MIKROBIOLOGI.
Microbial Numbers and Activity During Infiltration of Septic-Tank Effluent in a Subsurface Sand Filter.
W91-02789 5D

SYDNEY UNIV. (AUSTRALIA). INST. OF MARINE ECOLOGY.
Effects of Oil Spills on Macro-Invertebrates of Saltmarshes and Mangrove Forests in Botany Bay, New South Wales, Australia.
W91-02912 5C

SYRACUSE RESEARCH CORP., NY. AQUATIC TOXICOLOGY LAB.
Asiatic Clam, Corbicula spp., as a Biological Monitor in Freshwater Environments.
W91-02944 5A

SYRACUSE UNIV., NY. ENVIRONMENTAL ENGINEERING PROGRAM.
Effects of Iron Cycling on Pb-210 Dating of Sediments in an Adirondack Lake, USA.
W91-02071 2J

TAHAL-WATER PLANNING FOR ISRAEL LTD., TEL-AVIV.
Aquifers as Components of Water Resources Systems.
W91-02709 4B

Role of Groundwater in Israel's Integrated Water System.
W91-02714 4B

TECHNICAL UNIV. OF DENMARK, LYNGBY. INST. FOR TEKNISK GEOLOGI.
Saturated Hydraulic Conductivity of Clayey Tills and the Role of Fractures.
W91-02168 2F

TECHNICAL UNIV. OF DENMARK, LYNGBY. INST. OF HYDRODYNAMICS AND HYDRAULIC ENGINEERING.
Head Losses in Storm Sewer Manholes: Submerged Jet Theory.
W91-02916 8B

TECHNISCHE UNIV. BRAUNSCHWEIG (GERMANY, F.R.). LEICHTWEISS-INST. FUER WASSERBAU UND GRUNDBAU.
Decomposition and Elimination of Typical Pollutants from Sanitary Landfills in Porous Aquifers.
W91-02693 5B

TECHNISCHE UNIV., DRESDEN (GERMAN D.R.). SEKTION WASSERWESEN.
Simple Method to Distinguish Between Polyphosphate and Other Phosphate Fractions of Activated Sludge.
W91-02790 5D

TECHNISCHE UNIV. HAMBURG-HARBURG (GERMANY, F.R.). ARBEITSBEREICH UMWELTSCHUTZTECHNIK.
Sediment-Water-Equilibria: The Sorption of Volatile Chlorinated Hydrocarbons and Dichloro Benzenes by Sediments. (Sediment-Wasser-Gleichgewichte: Verhalten fluchtiger Chlorkohlenwasserstoffe und der Dichlorbenzole an Gewassersedimenten).
W91-02668 5B

TENNESSEE STATE UNIV., NASHVILLE. DEPT. OF BIOLOGICAL SCIENCES.
Artificially Induced Metamorphosis Acetone in Acris gryllus.
W91-02201 5C

TENNESSEE UNIV. AT MARTIN.
Aquatic and Certain Wetland Vascular Vegetation of Reelfoot Lake, 1920s-1980s. III. Submersed Macrophytes.
W91-02581 2H

Aquatic and Certain Wetland Vascular Vegetation of Reelfoot Lake, 1920s-1980s. IV. Seasonally Emergent Macrophytes.
W91-02582 2H

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF AGRICULTURAL ECONOMICS.
Pretest Analyses of Water Demand in Thirty Communities.
W91-02855 6D

TEXAS A AND M UNIV., COLLEGE STATION. DEPT. OF BIOCHEMISTRY AND BIOPHYSICS.
Detection of Organophosphorus Pesticide Detoxifying Bacterial Colonies, Using UV-Photography of Parathion-Impregnated Filters.
W91-02200 5B

TEXAS AGRICULTURAL EXPERIMENT STATION, LUBBOCK.
Modeling Infiltration into a Sealing Soil.
W91-02878 2G

EXAS CHRISTIAN UNIV., FORT WORTH. NVIRONMENTAL SCIENCES PROGRAM.
Septic Tank and Agricultural Non-Point Source Pollution Within a Rural Watershed.
W91-02177 5B

EXAS UNIV. AT AUSTIN. CENTER FOR RANSPORTATION RESEARCH.
Investigation of Rest Area Requirements: Appendix-Pertinent Rest Area Literature.
W91-02620 5D

EXAS UNIV. AT AUSTIN. DEPT. OF HEMISTRY AND BIOCHEMISTRY.
Preconcentration of Copper on Algae and Determination by Slurry Graphite Furnace Atomic Absorption Spectrometry.
W91-02191 5A

EXAS UNIV. AT AUSTIN. DEPT. OF CIVIL NGINEERING.
Watershed Delineation with Triangle-Based Terrain Models.
W91-02525 2E

EXAS UNIV. AT DALLAS, RICHARDSON. ST. FOR GEOSCIENCES.
Fan-Delta and Braid-Delta Systems in Pennsylvanian Sandia Formation, Taos Trough, Northern New Mexico: Depositional and Tectonic mplications.
W91-02519 2J

EXAS UNIV., AUSTIN. BUREAU OF ONOMIC GEOLOGY.
Hydrologic Hydrochemical Characterization of Texas Frio Formation Used for Deep-Well Injection of Chemical Wastes.
W91-02814 5B

ANJIN INST. OF ENVIRONMENTAL OTECTION AND SCIENCES (CHINA).
rediction on Eutrophication of Reservoir uqiao.
W91-02383 5G

KYO INST. OF TECH. (JAPAN). DEPT. OF IL ENGINEERING.
Width and Depth of Self-Formed Straight ravel Rivers with Bank Vegetation.
W91-02865 2E

RONTO UNIV. (ONTARIO). DEPT. OF IL ENGINEERING.
nergy Relations in Transient Closed-Conduit low.
W91-02522 8B

RONTO UNIV. (ONTARIO). DEPT. OF YSICS.
ysics of Supercooling of Thin Water Skins overing Gyrating Hailstones.
W91-02119 2C

RONTO UNIV. (ONTARIO). DEPT. OF OLOGY.
atios in Aquatic Sciences: Statistical Shortcomgs with Mean Depth and the Morphoedaphic dex.
W91-02069 7C

ONTO UNIV. (ONTARIO). DIV. OF LIFE CNCES.
eld Study of the Effects of Water Temperare, Discharge and Trout Odour on the Drift of eam Invertebrates.
W91-02454 2H

NITY COLL., DUBLIN (IRELAND). IRONMENTAL SCIENCES UNIT.
mporal Variability of Water Quality and the plications for Monitoring Programmes in sh Limestone Aquifers.
W91-02682 7A

UKAEA ATOMIC ENERGY RESEARCH ESTABLISHMENT, HARWELL (ENGLAND). THERMAL HYDRAULICS DIV.
Split of Two-Phase Flow at a Horizontal T-Annular and Stratified Flow.
W91-02613 8B

ULSTER UNIV., COLERAINE (NORTHERN IRELAND). LIMNOLOGY LAB.
Biologically Available Phosphorus Retention by the Kis-Balaton Reservoir.
W91-02375 2H

UNIVERSIDAD AUTONOMA DE BARCELONA (SPAIN). CENTRE DE RECERCA ECOLOGICA I APLICACIONS FORESTALS.
Precipitation, Throughfall, Soil Solution and Streamwater Chemistry in a Holm-Oak (Quercus ilex) Forest.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 24, NUMBER 4
APRIL 1991

-02959 -- W91-03920
EN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Geological Survey, U.S. Department of the Interior, and published monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Water Resources Division, U.S Geological Survey, MS 425, Reston, VA 22092. The **SWRA JOURNAL** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $170.00, Journal and Annual Indexes, $200 00; Indexes only, $80.00. Other Addresses, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

LIBRARY U. S. Geological Survey

SELECTED WATER RESOURCES ABSTRACTS

A monthly publication of the Geological Survey
U.S. Department of the Interior

VOLUME 24, NUMBER 4
APRIL 1991

W91-02959 -- W91-03920

The Secretary of the Interior has deterimined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Office of Management and Budget through September 1991.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a monthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Water Resources Scientific Information Center. The cumulative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE WATER RESOURCES SCIENTIFIC INFORMATION CENTER DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

MAIN INDUCED CHANGES IN RAINFALL-RUNOFF RELATIONSHIP FOR A MOUNTAINOUS WATERSHED.
Ministry of Agriculture, Jerusalem (Israel). Hydrological Service.
A. Ben-Zvi, and M. Langerman.
Pirineos: Revista de Ecologia de Montana PRNOAJ, Vol. 134, p 9-21, 1989. 3 fig, 6 tab, 7 ref.

Descriptors: *Cloud seeding, *Hydrologic models, *Israel, *Mountain streams, *Rainfall-runoff relationships, *Small watersheds, Flow discharge, Regression analysis, Runoff volume, Watershed management.

Historical comparison of records for a small mountainous watershed in Israel indicates a substantial reduction of the flow volume with regard to the rainfall depth. A rainfall-runoff model of the linear regression type was used to study the data. Cloud seeding has been shown to cause an increase in the runoff volume with regard to the rainfall. The only other known factor which can be so effective is the extensive watershed management operation carried out in this area in the 1950s. With regard to the rainfall depth, the mean annual volume of the flow has decreased by 45% of its historic value. (Author's abstract)

GLOBAL RIVER RUNOFF CALCULATED FROM A GLOBAL ATMOSPHERIC GENERAL CIRCULATION MODEL.
National Aeronautics and Space Administration, New York. Goddard Inst. for Space Studies.
G. L. Russell, and J. R. Miller.
Journal of Hydrology JHYDA7, Vol. 117, No. 1/4, p 241-254, September 1990. 5 fig, 3 tab, 20 ref.

Descriptors: *Atmospheric circulation, *Climatology, *Hydrologic models, *Model studies, *Rivers, *Runoff, *Runoff forecasting, Evapotranspiration, Groundwater storage, Parameterization, Precipitation, Rainfall-runoff relationships.

An atmospheric general circulation model was used to calculate runoff for the major rivers of the world. The model has a horizontal resolution of 4 x 5 degrees, but the runoff from each grid box within a particular river's drainage basin was summed on a resolution of 2 x 2.5 degrees to obtain the runoff at the river mouth. The mean annual runoff was calculated and compared with observations for 33 of the world's largest rivers. For about half of the rivers with annual runoff in excess of 200 cu km, the model runoff is within about 20% of the observed value. The model overpredicts the runoff for rivers with less than 200 cu km/yr. Some of the inaccuracy in the runoff predictions occurs because of poor model precipitation fields, but the model's parameterizations of groundwater storage and evapotranspiration are also suspect. New parameterizations, including the effects of both soil type and vegetation, should be investigated. In addition to being a good diagnostic for atmospheric modelers, the runoff that may occur during future climate changes can also be studied with these models. (MacKeen-PTT)

ASSESSING HYDROLOGIC MODEL NONLINEARITY USING RESPONSE SURFACE PLOTS.
Newcastle Univ. (Australia). Dept. of Civil Engineering.
G. Kuczera.
Journal of Hydrology JHYDA7, Vol. 118, No. 1/4, p 143-161, October 1990. 16 fig, 3 tab, 18 ref.

Descriptors: *Hydrologic models, *Model studies, *Multivariate analysis, *Parametric hydrology, *Uncertainty, Case studies, Numerical analysis, Probability distribution.

When a conceptual hydrologic model is calibrated to observed data, a posterior distribution summarizing uncertainty about model parameters can be derived. For models with more than two parameters, this distribution can be very awkward to work with. However, when a model is approximately linear over the region of parameter space with appreciable posterior density, the posterior distribution can be approximated by a multivariate normal distribution which provides a powerful tool for studying parameter uncertainty, testing hypotheses, and determining the reliability of model predictions. Model nonlinearity can be assessed using numerical measures. Complementing these measures are response surface plots. When interpreting response surface plots for models with more than two parameters, it is argued that linearized conditional probability regions should be displayed on response surface plots to highlight the region of likely parameter values. Where significant parameter interaction exists, it is possible that only a small fraction of the response surface will display probable model parameter values. In such cases, generating the response surface in principal component planes is computationally more efficient. Two case studies using four-parameter conceptual hydrologic models illustrate these points. (Author's abstract)

CLIMATE FACTOR FOR SMALL-BASIN FLOOD FREQUENCY.
Geological Survey, Denver, CO. Water Resources Div.
R. W. Lichty, and M. R. Karlinger.
Water Resources Bulletin WARBAQ, Vol. 26, No. 4, p 577-586, August 1990. 4 fig, 10 tab, 17 ref.

Descriptors: *Climatology, *Flood basins, *Flood forecasting, *Flood frequency, *Hydrologic models, *Rainfall-runoff relationships, Climatic data, Data interpretation, Flood data, Kriging, Mathematical analysis, Mathematical models, Regression analysis, Watersheds.

A climate factor, CT, (T = 2-year, 25-year and 100-year recurrence intervals) that delineates regional trends in small-basin flood frequency was derived using data from 71 long-term rainfall record sites. Values of CT at these sites were developed by a regression analysis that related rainfall-runoff model estimates of T-year floods to a sample set of 50 model calibrations. CT was regionalized via kriging to develop maps depicting its geographic variation for a large part of the United States east of the 105th meridian. Kriged estimates of CT and basin-runoff characteristics were used to compute regionalized T-year floods for 200 small drainage basins. Observed T-year flood estimates also were developed for these sites. Regionalized floods are shown to account for a large percentage of the variability in observed flood estimates with coefficients of determination ranging from 0.89 for 2-year floods to 0.82 for 100-year floods. The relative importance of the factors comprising regionalized flood estimates is evaluated in terms of scale (size of drainage area), basin-runoff characteristics (rainfall-runoff model parameters), and climate (CT). (Author's abstract)
W91-03853

RUNOFF VOLUME ESTIMATION USING GIS TECHNIQUES.
National Park Service, Denver, CO. Denver Service Center.
M. M. Stuebe, and D. M. Johnston.
Water Resources Bulletin WARBAQ, Vol. 26, No. 4, p 611-620, August 1990. 4 fig, 2 tab, 21 ref.

Descriptors: *Flood routing, *Geographic information systems, *Hydrologic models, *Rainfall-runoff relationships, Data interpretation, Mathematical analysis, Mathematical models, Simulation analysis, Surface runoff, Watersheds.

Rainfall-runoff of six watersheds was modeled via the Soil Conservation Service runoff curve number model in two ways: conventionally (manually) and via a geographic information system (GIS). Input data (elevation, soils and landcover) were digital for the latter method. In contrast to previous studies, the GIS was used for all phases of the modeling process, including watershed delineation and routing of runoff. A comparison between the two methods was consistent with results reported by others and indicates that the use of GIS is an acceptable alternative to the conventional method for watersheds lacking relatively flat terrain. Given this limitation, the GIS method may prove advantageous over manual methods when study areas are large or numerous, runoff is modeled repetitively, alternative landcover scenarios are explored, or a digital database already exists for the study area. (Author's abstract)

VEGETATION AND CLIMATE OF THE LATE CAINOZOIC IN THE MURRAY BASIN AND THEIR BEARING ON THE SALINITY PROBLEM.
New South Wales Univ., Kensington (Australia). School of Biological Sciences.
H. A. Martin.
BMR Journal of Australian Geology & Geophysics BJAGDT, Vol. 11, No. 2/3, p 291-299, 1990. 7 fig, 1 tab, 30 ref, append. Australian Research Grants Scheme.

Descriptors: *Australia, *Geochemistry, *Geologic history, *Murray-Darling River Basin, *Paleohydrology, *Saline groundwater, *Saline water intrusion, *Salinity, Forest hydrology, Forests, Geohydrology, Marine environment, Paleoclimatology, River systems, Salt marshes, Vegetation establishment.

The Murray Basin, in southeastern Australia, was forested throughout the Tertiary, becoming open woodlands and grasslands in Plio-Pleistocene time. Precipitation was very high through the early Tertiary, with step-like decreases beginning in the late Oligocene-early Miocene. In the mid-late Miocene, widespread rainforests disappeared and were replaced with eucalypt wet sclerophyll forests which were burnt on a regular basis. For a brief interval in the late Miocene-early Pliocene, there is a resurgence of Nothofagus which forms a well defined stratigraphic horizon. The Nothofagus phase is well marked in the major river systems of the western slopes of the Eastern Highlands, but it has also been found in the western Murray Basin. The climate was wetter at this time, which is thought to correlate with the late Miocene-early Pliocene maximum marine transgression. An assemblage with a high chenopod type and Asteraceae pollen content is deceptively like modern assemblages of arid regions, but close examination reveals a salt-marsh environment associated with the early mid-Miocene marine transgression. Throughout the Tertiary and into the early Pleistocene, the only indications of salinity are associated with marine/marginal marine environments. There is no evidence of dryland salinity, as seen today. (Author's abstract)

M. Glass, and G. W. Felde.
Available from the National Technical Information Service, Springfield, Virginia 22161, as AD-A210 320. Price codes: A02 in paper copy, A01 in microfiche. Report no. GL-TR-89-0167, 7 July 1989. 4 p, 7 fig, 8 ref.

Descriptors: *Infrared imagery, *Meteorological data collection, *Meteorology, *Remote sensing, *Satellite technology, *Storms, *Tropical cyclones, Algorithms, Clouds, Convective precipitation, Microwaves.

A group of tropical cyclones of varying peak intensities occurring in the western North Pacific during 1988 were selected for study. Infrared and visible imagery data from the Operational Linescan System (OLS) sensor and passive microwave imagery data from the 7-channel Special Sensor Microwave/Imager (SSM/I) sensor were used. Both instruments are on board the same polar-orbiting Defense Meteorological Satellite System satellite. Imagery analysis of each storm and surrounding environment was performed during different stages of its life. It was concluded that coincident SSM/I (microwave) and OLS (visible and infrared) imagery data show promise as a new tool for delineating the cloud band structure, locating the intense convective cells within the cloud bands, and locating the storm center of tropical cyclones. Wind speed and rain rate fields derived from SSM/I algorithms agreed qualitatively with known features of tropical cyclones. These derived paramcters will become more useful as algorithms arc refined. (Fish-PTT)

C. W. Rogers.
Available from the National Technical Information Service, Springfield, Virginia 22161, as AD-A210 254. Price codes: A04 in paper copy, A01 in microfiche. Report no. 7330-2, June 1985. 52 p, 5 fig, 2 tab, 6 ref, 4 append. Contract no. N00228-84-C-3157.

Descriptors: *Clouds, *Computer models, *Handbooks, *Meteorological data, *Model studies, Computer programs, Precipitation.

A User's Manual for Smith-Feddes (S-F) model for cloud moisture content has been developed to provide information necessary to use the system effectively. This S-F program uses height of cloud base and top, cloud type, cloud cover percentage, presence of precipitation and vertical profiles of temperature and pressure to provide vertical profiles of cloud condensed moisture content (CMC) and the distribution of cloud particle number concentration by particle size. When precipitation is present, the same information is provided for the precipitation, both in-cloud and below cloud base to the ground. The computer used is the CDC machine, code-named HAL, at the Naval Surface Weapons Center's Fleet Numerical Oceanography Center (FNOC). The S-F input is card image, free format for latitude and longitude, and 9 track, 1600 BPI magnetic tape for the RTNEPH (Real Time NEPHanalysis) cloud data and Terrain tapes. Output is printed. Input to PNTDAT temperature and pressure data is card image in directive format. Output from PNTDAT is card images on a temporary disk file called TAPE7, which is then read by the S-F program. Standard FNOC procedures for running a computer program on machine HAL are to be used. (Fish-PTT)

SEQUENTIAL PRECIPITATION SAMPLERS: A LITERATURE REVIEW.
Nebraska Univ. at Omaha. Dept. of Chemistry.
F. C. Laquer.
Atmospheric Environment Part A: General Topics AEATEN, Vol. 24, No. 9, p 2289-2297, September 1990. 1 tab, 114 ref.

Descriptors: *Instrumentation, *Literature review, *Meteorological data collection, *Precipitation, *Rain gages, *Sample preservation, *Sampling, Chemistry of precipitation, Design criteria, Monitoring, Precipitation scavenging, Trace analysis.

The literature of sequential or within-event precipitation sampler construction and applications is reviewed. Collection devices are classified as manually segmenting samplers, linked collection vessels, automatically segmenting samplers and continuous monitors. The rainfall collectors have in common a large surface area to collect the precipitation and funnels commonly constructed from polyethylene or stainless steel. Early applications of sequential samplers were to determine radioactive fallout removal processes, and to monitor cloud seeding studies, below cloud scavenging and urban and precipitation scavenging studies. The collector design is highly dependent on the type of sample to be taken, i.e., major ions, trace metals, or organics. The collector should be covered to exclude dry deposition that would bias the sample. Deposition monitoring may use either sampling at unit times or at unit precipitation volumes. Precipitation scavenging research may sample by either method. Continuous monitoring or real time analysis of precipitation using a flow through collection system is dynamically attractive. It requires rapidly responding sensors, and a data collection system. The choice of chemical species to be measured determines how frequently the samples are transported to the laboratory. An alternative to immediate analysis is to trap the analyte, immediately converting it into a stable product. The number of samples and the volume to be taken depends on the chemical analysis to be performed. The collection surface for rainfall to be analyzed for the major inorganic ions may be plastic or stainless steel. When trace metals are to be determined in rainwater, the collection surface and sample bottle should be acid washed polyethylene or Teflon. Rainwater used for the determination of organic compounds should be collected on inert surfaces such as glass or stainless steel. Metal funnels can be more easily heated to melt snow than plastic funnels and may hold up better against the elements. The distance between the funnel and the sample container should be short to minimize particle losses to the tubing or other alterations of the sample. (Geiger-PTT)

INTERCOMPARISON OF CONTINUOUS FLOW, AND AUTOMATICALLY SEGMENTING RAINWATER COLLECTION METHODS FOR DETERMINING PRECIPITATION CONDUCTIVITY AND PH.
Nebraska Univ. at Omaha. Dept. of Chemistry.
F. C. Laquer.
Atmospheric Environment Part A: General Topics AEATEN, Vol. 24, No. 9, p 2299-2306, September 1990. 3 fig, 2 tab, 37 ref.

Descriptors: *Acid rain, *Conductivity, *Hydrogen ion concentration, *Instrumentation, *Precipitation, *Rain gages, *Sampling, Automation, Comparison studies, Electrodes, Performance evaluation, Precipitation intensity.

Two precipitation intensity or volume weighted rainwater collection methods, a continuous flow measuring device and a fraction collection system were compared during measurements of pH and conductivity of rainwater. The automatic fraction collector accumulated samples for later laboratory analysis at 0.2 mm intervals. The flow system measured rainwater conductivity and pH every 0.1 mm of rainfall. The flow system used a 60 cm diameter polypropylene funnel while the fraction system used a 40 cm diameter stainless steel funnel to collect the rainwater. Conductivity of the samples was measured in collected sequence using a dip cell. The pH of the fractions was measured using a pH electrode containing an annular ceramic junction recommended for rainwater measurements. Conductivity data from summer thunderstorms in Omaha, Nebraska, collected by the two systems were comparable to each other with integrated collection by a wet-only event collector. The conductivity of the rainwater in both the flow and the fraction systems rapidly decreased at the beginning of the rainfall and then increased at the end of the event. The flow system pH measurement exhibited bias with respect to the fraction collection system due to insufficient electrode equilibration time, especially when the precipitation conductivity was low (<10 microS/cm). INTERACTION BETWEEN EQUILIBRATION PROCESSES AND WET OR DRY DEPOSITION.
California Inst. of Tech., Pasadena. Dept. of Chemical Engineering.
S. N. Pandis, and J. H. Seinfeld.
Atmospheric Environment Part A: General Topics AEATEN, Vol. 24, No. 9, p 2313-2327, September 1990. 9 fig, 20 ref. State of California Air Resources Board Agreement A932-054.

Descriptors: *Acid rain, *Aerosols, *Dry deposition, *Mathematical models, *Nitrogen compounds, *Path of pollutants, Deposition, Fog, Hydrogen peroxide, Nitric acid, Numerical analysis.

Three cases were examined to study the relationship between equilibration processes and deposition. The first case concerns a gas phase species A(g) that can be reversibly transferred to the aerosol phase as B(s). In the second case the gas-phase

species (e.g. HCHO, H2O2, O3) in the presence of droplets of liquid water content C is transferred reversibly to the aqueous-phase as B(aq). In the third case two gases A(g) and B(g) react to give a volatile aerosol AB(s), and in general all three species have different deposition velocities. This case is typified by the system of NH3(g), HNO3(g), and NH4NO3(s). Results of numerical analysis show that atmospheric equilibration processes between two phases with different deposition velocities have the potential to affect significantly the amount of total material deposited on the ground. The magnitude of the effects of the equilibration processes depends primarily on the ratio of the deposition velocities of the two phases, on the production/emission rate of the gas phase species, and on the initial distribution of species between the two phases. The deposition of a condensable species equilibrating between gas and aerosol phases can increase by as much as 20 times over that when equilibration processes are not present under gas-phase production rate) or to decrease by as much as 15 times (very small aerosol particles, most of the material initially in the gas phase and high gas-phase production rate). In fog episodes, the deposition of a gaseous species with a Henry's Law constant between 1,000 and 1,000,000 M/atm (e.g. SO2 for pH between 4.5 and 7, H2O2, HCHO etc.) can be enhanced by as much as a factor of 3 because of its transfer to the aqueous phase. For the NH3-HNO3-NH4NO3 system the total deposition can be reduced by as much as a factor of 3 for typical conditions in a polluted atmosphere and small initial concentration of aerosol NH4NO3 with NH3 initially dominating HNO3 in the gas phase. If an operator splitting scheme is used in a mathematical model both equilibration and removal processes should be included in the same operator or very small operator time steps (typically less than 1 min) will be necessary. PRINCIPAL COMPONENT ANALYSIS OF THE LAMB CATALOGUE OF DAILY WEATHER TYPES: PART 2, SEASONAL FREQUENCIES AND UPDATE TO 1987.
University of East Anglia, Norwich (England). Climatic Research Unit.
T. R. Briffa, P. D. Jones, and P. M. Kelly.
International Journal of Climatology IJCLEU, Vol. 10, No. 6, p 549-563, September/October 1990. 9 fig, 4 tab, 7 ref. DOE Grant DE-FG02-86ER69017.

Descriptors: *Climatology, *Meteorology, *Principal component analysis, *Seasonal variation, *Weather patterns, Air temperature, Great Britain, Precipitation, Temporal distribution.

Principal component analysis is applied to seasonal weather-type frequencies from the Lamb Catalogue of Daily Weather Types for the British Isles. Four combinations of the major weather types are identified, which represent around 70% of the variance of the data set. The four generic combinations are indices of the balance between: the westerly and cyclonic types; the westerly and anticyclonic types; the cyclonic or anticyclonic and directional types; and the northerly and other directional types. The significant relationships between the seasonal components and temperature and rainfall are physically reasonable, reflecting changes in the character of the meridional flow and the frequency of cyclonicity and anticyclonicity. A pronounced change in the character of the synoptic circulation over the British Isles has occurred in recent decades. A decline in the frequency of westerly weather types has been compensated for by an increase in the frequency of pure cyclonic and anticyclonic types and, dependent on season, directional types. This development suggests greater variability in the atmospheric circulation and related climatic parameters. The westerly decline has not been as marked in autumn. In autumn, though, there has been a notable shift towards greater southerliness at the expense of northerly weather types. (Geiger-PTT)

Descriptors: *Climatology, *Clouds, *Probability distribution, *Regional analysis, Satellite technology, Weather data collections, Weather patterns.

The ideas surrounding contingency co-occurrence probabilities of cloud types are discussed with respect to two types of probability: first, that given a lower level cloud (L) there is also an upper level cloud (U), P(L-> U), and secondly the probability that given an upper cloud layer there is a lower cloud layer, P(U->L). Particular emphasis is placed on the fact that analyses to date have considered the frequency of observation of co-occurrence, not the potentially more useful, co-existence probability. From four separate months of global surface observations the P(L->U) was calculated as a function of lower level cloud amount on a global, regional, and individual station basis for (1) stratiform and altiform, and (2) stratiform and cirriform cloud type combinations. Global patterns of P(L->U) behavior are somewhat similar to regional patterns produced by previous work and are, on occasions, reproducible on a regional scale and, in some instances, by individual stations. Values of P(L->U) involving lower level overcasts are required in the calculation of the P(U->L) term, thus rendering climatological estimates of P(L->U) susceptible to biasing if an inappropriate value of P(L->U) for L = overcast is chosen. To demonstrate this effect, monthly global climatologies of P(U->L) were generated for several combinations of upper and lower cloud types using (1) an assumed mean value for the overcast case, and (2) a modification to the previously assumed overcast P(L->U) values, as suggested here. Comparison of these climatologies revealed differences, widely spread across the globe, of mostly within + or -10% according to cloud type, but with a few larger changes in excess of 30%. CLIMATIC CLASSIFICATION FOR QUEENSLAND USING MULTIVARIATE STATISTICAL TECHNIQUES.
Jaffna Univ. (Sri Lanka). Dept. of Geography.
M. Puvaneswaran.
International Journal of Climatology IJCLEU, Vol. 10, No. 6, p 591-608, September/October 1990. 8 fig, 4 tab, 14 ref.

Descriptors: *Australia, *Climatology, *Multivariate analysis, *Rainfall, *Regional analysis, *Spatial distribution, Air temperature, Cluster analysis, Relative humidity, Statistical methods, Weather data collections.

An array of 28 climatic variables for 113 stations in Queensland, Australia, was subjected to factor analysis and cluster analysis to obtain an objective climatic classification for this region. The factor analytical approach elucidated three major factors from the matrix: a humidity factor, a temperature factor, and a rainfall factor. Spatial variation of factor scores was described and linear equations were compiled using the factor loadings that were significant. By grouping these factors scores with the aid of a distance-grouping technique, Queensland was classified into three major homogeneous climatic regions. A further 12 subclimatic regions were also identified. These regions were considerably different than Koppen's classification scheme and were determined solely by climatic factors and not external factors such as soil type and vegetation. DROUGHT OVER ZIMBABWE IN A REGIONAL AND GLOBAL CONTEXT.
Department of Meteorological Services, Harare (Zimbabwe).
C. H. Matarira.
International Journal of Climatology IJCLEU, Vol. 10, No. 6, p 609-625, September/October 1990. 8 fig, 2 tab, 53 ref.

Descriptors: *Climatology, *Drought, *El Nino/Southern Oscillation, *Meteorology, *Rainfall, *Regional analysis, *Zimbabwe, Cyclones, Meteorological data, Seasonal variation.

Meteorological conditions that lead to dry and wet episodes over Zimbabwe were examined by correlation analyses between the Southern Oscillation Index and rainfall over south-eastern central Africa. The results showed significant correlation between the Southern Oscillation (SO) and seasonal rainfall over the region. The results also indicated that the SO signal was stronger over the southeast of Zimbabwe and along the coastal areas of Mozambique. El Nino events seemed to be associated with below normal rainfall over Zimbabwe, while cold events, which were the opposite extreme of the SO, were accompanied by above average rainfall. Three-month seasonal (December-February) deviations of 1000-millibar temperature, surface pressure, and the 500-millibar geopotential height from the long-term mean were analyzed during wet periods and towards the ocean area during dry episodes. A similar pattern was observed at the 500-millibar level. A comparison of wet and dry seasons in relation to the temperature anomaly field pointed to an association between warmer 1000-millibar surface temperatures around the African subcontinent and above normal seasonal rainfall. Correlation analysis showed that a high incidence of tropical cyclones in the Mozambique Channel was associated with below normal rainfall over Zimbabwe. (Author's abstract)

REGIONALITY AND PERIODICITY OBSERVED IN RAINFALL VARIATIONS OF THE BAIU SEASON OVER JAPAN.
Tsukuba Univ. (Japan). Inst. of Geoscience.
A. Murata.
International Journal of Climatology IJCLEU, Vol. 10, No. 6, p 627-646, September/October 1990. 15 fig, 3 tab, 37 ref.

Descriptors: *Climatology, *Japan, *Meteorology, *Rainfall, *Regional analysis, *Seasonal variation, Principal component analysis, Temporal distribution.

The regionality of rainfall variations of the Baiu, a rainy season over Japan, was investigated with special reference to periodicity. Using the Varimax rotated principal component analysis (PCA), Japan was divided into eight regions based on natural-logarithm-transformed rainfall data of June. In order to find significant rainfall variations from a sequence of rainfall data in each region, non-rotated PCA was applied to the rainfall data for each region. Its first component score was defined as the rainfall variation index (RVI). Four regions showed statistically significant periodicities of 10, 8, 4, or 2.2 yr in rainfall variations. In addition, the rainfall variations revealed a similarity in the general shapes of spectral density for each region. The temporal variations of each periodicity showed non-stationary changes. This feature was especially distinct for periodicities at 4 and 2.2 yr. From the

results of squared coherence, it was shown that these periodicities are closely related to variations of the North Pacific High and the Okhotsk High air masses. The validity of the regional division proposed in the present study was confirmed in comparison with other studies. Analysis of correlation coefficients between rainfall amounts and rainfall variation indices during the Baiu rainy season indicated that rainfall variations in June and July displayed satisfactory seasonal representativity. (Author's abstract)

THEORETICALLY DERIVED DISTRIBUTION FOR ANNUAL RAINFALL TOTALS.
K. J. A. Revfeim.
International Journal of Climatology IJCLEU, Vol. 10, No. 6, p 647-650, September/October 1990. 2 tab, 8 ref.

Descriptors: *Meteorology, *Model studies, *Rainfall, *Statistical analysis, Synoptic analysis, Theoretical analysis.

Rainfall occurs as synoptic events, and in many climates annual totals are made up of a moderate to large number of events of varying amounts. Assumption of an underlying Poisson process of event occurrence leads to a simple statistical density, in terms of physically meaningful parameters for the fourth root of annual totals. Analysis of data for four locations (Milan, Italy, Stensele and Kristianstad, Sweden, and Kelburn, New Zealand) gave estimates of event-recurrence rates in agreement with the number of rain-days in the local climates. The density factor for the fourth root of annual rainfall totals may be useful for discriminating between rainfall totals in regimes such as El Nino/La Nina when the distributions are less well represented by overlapping Guassian forms. This analysis complements the compound Poisson distribution which is a realistic model for monthly or other short-term totals. (Author's abstract)

COMPUTED NORMAL RANGE OF IOWA STATEWIDE JULY PRECIPITATION.
Iowa State Univ., Ames. Dept. of Agronomy.
H. C. Vaughan, D. S. Sheets, and G. R. White.
Journal of the Iowa Academy of Science JIASEB, Vol. 97, No. 3, p 91-97, September 1990. 10 fig, 1 tab, 5 ref.

Descriptors: *Climatology, *Iowa, *Meteorological data, *Meteorology, *Precipitation, *Rainfall distribution, Distribution patterns, Moisture deficiency, Rainfall area, Seasonal variation, Standard deviation, Statistical analysis.

Iowa summer rainfall distributions were examined to identify small-scale anomalies. Examination of extremely wet and dry summer months showed that large rain amounts fall mainly in small, cellular areas for both extremely wet and dry months. These configurations result from individual rainfall events. Analysis of the distribution of mean July rainfall across the state revealed significant anomalous wet and dry regions that contrast with the background, east-west rainfall gradient. Because of the skewed nature of summer rainfall distributions, the median value was used to represent a more realistic expected rainfall amount for any given year. Some parts of the state had a more variable distribution and were more sensitive to the expected annual swing of one standard deviation. On the basis of statistical probabilities, these areas can expect summers of more severe moisture deficiencies to occur more often than in the rest of the state. (Author's abstract)

ATMOSPHERIC RESPONSE TO 1988 DROUGHT CONDITIONS AND FUTURE CLIMATE IMPLICATIONS.
Iowa State Univ., Ames. Dept. of Agronomy.
M. D. McCorcle.
Journal of the Iowa Academy of Science JIASEB, Vol. 97, No. 3, p 84-87, September 1990. 6 fig, 10 ref. Iowa Agriculture and Home Economics Experiment Station Project 2804.

Descriptors: *Agricultural hydrology, *Climatic changes, *Climatology, *Drought effects, *Global warming, *Iowa, *Meteorology, *Precipitation, *Weather forecasting, Air temperature, Atmospheric circulation, Drought, Greenhouse effect, Model studies, Rainfall distribution, Soil moisture.

Plentiful precipitation in the central United States is one of the basic components of the successful agricultural industry in the Corn Belt. A combination of moisture, wind, and topographic factors creates an ideal condition for rainfall over most of the region during the late spring and early summer. In 1988, many ingredients necessary for wet weather were absent. The region experienced a drought unequalled since the 1930s. The drought of 1988 demonstrated that the symptom of drought, namely, dry soils, can exacerbate and even perpetuate drought conditions by decreasing available moisture, altering circulation patterns vital to storm development, and increasing air temperatures. Models that predict future climate change, forecast that dry conditions, such as those in 1988, will become more prevalent in the future 'greenhouse' atmosphere of the central United States. Many of the smaller-scale effects, which were important in perpetuating the drought of 1988, could not be anticipated from these poor-resolution climate models. Therefore, great care should be taken in interpreting these forecast results. (Author's abstract)

CLIMATE CHANGE AND THE POTENTIAL IMPACT ON THE SOIL RESOURCE.
Agricultural Research Service, Ames, IA.
J. L. Hatfield.
Journal of the Iowa Academy of Science JIASEB, Vol. 97, No. 3, p 82-83, September 1990. 15 ref.

Descriptors: *Agriculture, *Climatic changes, *Global warming, *Hydrologic cycle, *Soil management, *Soil water, Air temperature, Atmosphere, Atmospheric chemistry, Greenhouse effect, Nutrients, Precipitation, Resources management, Water use efficiency.

Climatic change will lead to changes in atmospheric carbon dioxide concentrations, temperature, and precipitation. There have been many predictions of the effect of climatic change on plant growth, but none on soil parameters or water use. To fully understand the implications of climatic change on soil management, the expected changes in soil temperature, water use, and water and nutrient use efficiency need quantification. The agricultural community is concerned today about sustainable agriculture. One of the key variables in sustainable agriculture systems is the soil. A changing climatic regime dictates that we understand how the parameters affecting the soil interface with a sustainable agriculture system. (Fish-PTT)

FACTORS ASSOCIATED WITH DISTRIBUTION OF RAINFALL IN THE GALILEE, ISRAEL.
Haifa Univ. (Israel). Dept. of Geography.
H. Kutiel.
Pirineos: Revista de Ecologia de Montana PRNOAJ, Vol. 134, p 41-58, 1989. 8 fig, 5 tab, 15 ref.

Descriptors: *Hydrologic models, *Israel, *Orography, *Rainfall distribution, *Regression analysis, Altitude, Latitudinal studies, Orographic precipitation, Spatial distribution.

Monthly totals from 30 stations in the Galilee, Israel, for 20 rainfall seasons (1960/61-1979/80) were regressed against the longitude, the latitude, and the altitude of the stations. The distribution of the order of entrance into the multiple regression model of the different independent variables resembles previous results for averaged data over the entire period. The results highlight a coherent period in terms of similar factors affecting the spatial rainfall distribution during February and March. Despite the fact that the orography is the main factor affecting the spatial rainfall distribution in the Galilee, during extremely wet periods (months or seasons) the spatial distribution is related more to the distance from the sea than to the altitude. USE OF COOPERATIVE WEATHER STATION DATA IN CONTEMPORARY CLIMATE RESEARCH.
Illinois State Water Survey Div., Champaign. Climate and Meteorology Section.
P. J. Lamb, and M. B. Richman.
Transactions of the Illinois Academy of Science TISAAH, Vol. 83, No. 1/2, p 70-81, 1990. 5 fig, 17 ref. NSF Grants ATM 83-12653 and 85-20877.

Descriptors: *Climatic data, *Climatology, *Meteorological data collection, *Precipitation mapping, *Weather data collections, Canada, Climatic changes, Correlation analysis, Networks, Prediction, Regional analysis, Spatial distribution.

Daily precipitation observations made at thousands of cooperative weather stations in the central U.S. and southern Canada during the May-August periods of 1949-1980 were distilled into a set for a grid-like network of 557 locations which were used to delineate areas of spatial precipitation coherence for a range of time scales and periods. This delineation was achieved by applying a variety of eigenvectorial techniques and correlation analysis to network station totals for 3, 7, 15, 30, 41, and 61 day periods. All analyses were performed for May-August as a whole; those for 3 day periods were also conducted on a half-monthly basis. The resulting regionalizations of the vast study domain into smaller areas of precipitation coherence were compared. The regionalizations seem particularly relevant to the predictive crop yield modeling that is now routinely performed for the growing season of the central U.S.; modelers are uncertain about the number, morphology, and spatial representativeness of the regions for which individual models should be utilized. Because the regionalizations also hold for the 3 day time scale, they may also have utility for the 48-96 hour prediction of precipitation. A related potential application is in studies of climatic change over the last 100-150 years. The spatial variation in the extent to which the 3-7 day regionalization changes as the precipitation totalling period is extended to 15, 30, 41, and 61 days provides a framework for investigating how short-period weather variations integrate to climate fluctuations. This study illustrates the great value of the voluntary observers who operated the cooperative weather stations. (Author's abstract)

IMPACT OF SEA SURFACE TEMPERATURE ANOMALIES ON THE RAINFALL OVER NORTHEAST BRAZIL.
California Univ., Los Angeles. Dept. of Atmospheric Sciences.
C. R. Mechoso, S. W. Lyons, and J. A. Spahr.
Journal of Climate JLCLEL, Vol. 3, No. 8, p 812-826, August 1990. 16 fig, 18 ref.

Descriptors: *Climatology, *Meteorology, *Temperature effects, *Water temperature, *Weather patterns, Atlantic Ocean, Marine climates, Northern Hemisphere, Pacific Ocean, Precipitation, Sea breezes, Weather, Wind.

The response of the tropical atmosphere to the sea surface temperature anomalies in the Northern Hemisphere spring of 1984 was investigated. The methodology for investigation consisted of comparing simulations with and without the global distribution of sea surface temperature anomalies in the boundary conditions of the UCLA General Circulation Model. At low levels, the response included weaker southeast trade winds over the Atlantic, increased precipitation off the northeast coast of Brazil, and reduced precipitation west of this region. The increased precipitation was due to enhanced convergence of moisture advected by the southeast trade winds, although the trades themselves were weaker. The results of the western equatorial Atlantic were in apparent agreement with the observed anomalous southern migration of the ITCZ in years with warm sea surface anomalies in the southern tropical Atlantic. There were strong anomalous trade winds over the Pacific extending east of the date line and weak wind anomalies over the maritime continent, in broad agreement with the observed. The sensitivity of the simulated atmospheric response over an ocean basin to using the sea surface temperature anomalies confined to the basin or in the global ocean was analyzed. It was found that there could be notable local differences in the results obtained using those procedures. In particular, the simulation with the sea surface temperature anomalies confined to the Pacific showed weak anomalous trade winds over the western part of this ocean basin and strong westerly anomalies over the maritime continent unlike that with the anomalies in the global ocean. SEA LEVEL AND RAINFALL CORRELATIONS IN AUSTRALIA: TROPICAL LINKS.
Flinders Inst. for Atmospheric and Marine Sciences, Bedford Park (Australia).
R. J. Allan, K. Beck, and W. M. Mitchell.
Journal of Climate JLCLEL, Vol. 3, No. 8, p 838-846, August 1990. 5 fig, 60 ref.

Descriptors: *Australia, *Climatology, *El Nino/Southern Oscillation, *Meteorology, *Rainfall distribution, *Sea level, Seasonal variation, Temperature effects, Water temperature, Weather patterns, Wind.

A preliminary study was made of simultaneous and lagged seasonal cross correlations between northern Australian sea level and district rainfall anomalies. Zero-lagged patterns showed strong links with the El Nino/Southern Oscillation phenomenon over northern and eastern Australia during austral winter-spring seasons. These findings were similar to, but more robust than, those reported for simultaneous cross correlations between Australian district rainfall and either the southern oscillation index. Darwin mean sea level pressure, or northern Australian seas surface temperatures. This appeared to be a consequence of the strong integrating response of northern Australian sea levels, particularly to inverse barometric and wind forcings on seasonal time scales. Such relationships were explored further in lagged cross correlations. As observed in other studies of seasonal persistence associated with El Nino/Southern Oscillation and anti-El Nino/Southern Oscillation phases, rainfall precursors extend in time from one to two seasons. However, significant seasonal cross correlations were found at longer intervals, reflecting the marked sea level response to the often observed anti-El Nino/Southern Oscillation to El Nino/Southern Oscillation sequence of the phenomenon. In particular, austral spring sea levels in northern Australia were negatively correlated with the following austral winter rainfall over parts of northern and south-southeastern Australia. At present an operational evaluation of precursors must await the installation of new telemetering tide gauges in northern Australian ports. (Author's abstract)

EIGHT-MONTH SAMPLE OF MARINE STRATOCUMULUS CLOUD FRACTION, ALBEDO, AND INTEGRATED LIQUID WATER.
Pennsylvania State Univ., University Park. Dept. of Meteorology.
C. W. Fairall, J. E. Hare, and J. B. Snider.
Journal of Climate JLCLEL, Vol. 3, No. 8, p 847-864, August 1990. 16 fig, 1 tab, 28 ref. NASA grant NAG 1-652.

Descriptors: *Albedo, *Cloud cover, *Cloud liquid water, *Meteorological data collection, *Meteorology, Clouds, Data collections, Irradiation, Weather.

As part of the First International Satellite Cloud Climatology Regional Experiment, a surface meteorology and shortwave/longwave irradiance station was operated in a marine stratocumulus regime on the northwest tip of San Nicolas Island off the coast of Southern California. Measurements were taken from March through October 1987, including a First International Satellite Cloud Climatology Regional Experiment Intensive Field Operation held in July. Algorithms were developed to use the longwave irradiance data to estimate fractional cloudiness and to use the shortwave irradiance to estimate cloud albedo and integrated cloud liquid water content. Cloud base height is estimated from computations of the lifting condensation level. The algorithms are tested against direct measurements made during the Intensive Field Operation; a 30% adjustment was made to the liquid water parameterization. The algorithms were then applied to the entire database. The stratocumulus clouds over the island were found to have a cloud base height of about 400 m, an integrated liquid water content of 75 g/sq m, a fractional cloudiness of 0.95, and an albedo of 0.55. Integrated liquid water content rarely exceeds 350 g/sq m and albedo rarely exceeds 0.90 for stratocumulus clouds. Over the summer months, the average cloud fraction shows a maximum at sunrise of 0.74 and a minimum at sunset of 0.41. Over the same period, the average cloud albedo shows a maximum of 0.61 at sunrise and a minimum of 0.31 a few hours after local noon (although the estimate is more uncertain because of the extreme solar zenith angle). The use of joint frequency distributions of fractional cloudiness with solar transmittance or cloud base height to classify cloud types appears to be useful. (Author's abstract)

PREDICTION OF NORTHEAST BRAZIL RAINFALL ANOMALIES.
Wisconsin Univ.-Madison. Dept. of Meteorology.
S. Hastenrath.
Journal of Climate JLCLEL, Vol. 3, No. 8, p 893-904, August 1990. 6 fig, 5 tab, 21 ref. NSF grant ATM-8722410.

Descriptors: *Climatology, *Meteorology, *Rainfall index, *Weather forecasting, Brazil, Data collections, Meteorological data collection, Precipitation, Rainfall, Seasonal variation, Temperature effects, Water temperature.

Expanding on earlier research, empirically based methods were developed for predicting March-September rainfall in northern Northeast Brazil. From a network of 27 raingage stations in Brazil's Nordeste, new rainfall index series were constructed for March-September and October-January. Data input to stepwise multiple regression models further included January values of the Tahiti minus Darwin pressure index, an index of sea surface temperature in the equatorial Pacific, and indices of the fields of meridional and zonal wind components and of sea surface temperature in the tropical Atlantic between 30 deg N and 30 deg S. Empirical orthogonal function analysis of the meridional and zonal wind components and sea surface temperature fields was used in construction the latter three indices. Throughout the study, a sharp distinction was kept between a dependent dataset (1921-42 and 1948-57) used as a training period and an independent portion of the record (1958-87) reserved for prediction experiments. Preseason rainfall was by far the most powerful predictor, allowing 52% of the interannual March-September variance in an independent dataset to be forecast. From experiments with unrestricted data input, a model with the predictors October-January, indices of the field of meridional wind components, and the index of sea surface temperature in the equatorial Pacific showed the best performance, capturing 71% of the March-September variance in the independent dataset. Experiments on the optimal length of the training period suggest that one of 20-30 years was adequate. Updating offers no advantage over a fixed training period. For the purposes of operational application, the maintenance and timely processing of raingage measurements was of paramount importance. The next important task, demanding considerably greater resources, would be the real-time monitoring of the surface wind field over the tropical Atlantic. (Author's abstract)

GREAT STORM OF 15/16 OCTOBER 1987: PASSIVE MICROWAVE EVALUATIONS OF ASSOCIATED RAINFALL AND MARINE WIND SPEEDS.
Bristol Univ. (England). Dept. of Geography.
E. C. Barrett, C. Kidd, J. O. Bailey, and C. G. Collier.
Meteorological Magazine MTMGA5, Vol. 119, No. 1418, p 177-187, September 1990. 7 fig, 2 tab, 22 ref.

Descriptors: *Data acquisition, *Meteorology, *Microwaves, *Rainfall, *Satellite technology, *Storms, *Wind velocity, England, Meteorological data, Microwave imagery, Rainfall distribution, Rainfall rate, Weather patterns.

Analyses of the Special Sensor Microwave Imager (SSM/I) data for the British Isles and surrounding waters from 15-16 October 1987 were performed. SSM/I carried by current US military meteorological satellites has proven capabilities for the evaluation of several weather-related parameters, including instantaneous rain areas and rain rates, and marine wind speeds. The highest wind speeds appeared in the Bay of Biscay, reaching over 61 kn in places, for the storm of 15-16 October 1987. High speeds were evident in some windward coastal regions, including the west coast of France, the Strait of Dover, and even parts of the west coast of Norway. Application of an SSM/I rainfall algorithm indicated that instantaneous rain rates were as high as 64-128 mm/h southwest of Cornwall, and even higher over Spain. The SSM/I algorithm was successful in depicting the rain in areas beyond the limits of radar coverage. The percentage correspondence between FRONTIERS radar and microwave rain/no rain pixels was 80% for the period from 13 to 19 October, 1987. It is concluded that the SSM/I instrument has clear potential for the monitoring of both rainfall and wind speeds over the British Isles region, especially over water. (MacKeen-PTT)

USE OF OPERATIONAL 0-6 AND 3-9 H QUANTITATIVE PRECIPITATION FORECASTS FOR PREDICTING HEAVY RAIN EVENTS.
National Weather Service, Silver Spring, MD. Techniques Development Lab.
J. P. Charba, and J. T. Moeller.
Available from the National Technical Information Service, Springfield, VA 22161, as PB90-103946/AS. Price codes: AO3 in paper copy, AO1 in

microfiche. June 1989. 36p, 20 fig, 7 tab, 11 ref.

Descriptors: *Meteorology, *Precipitation, *Weather forecasting, Isohyets, Rainfall forecasting, Statistical analysis.

New 0-6 and 3-9 h objective quantitative precipitation forecasts (OBJ) for the coterminous United States have been recently implemented in the National Weather Service. The forecasts are issued in the form of isohyets of both the maximum point precipitation amount and the probability of equalling or exceeding specific amounts in 40 x 40 n mi boxes. After taking into account differences in the event forecast, the performance of the isohyetical maximum amounts were compared with manual and model-generated quantitative precipitation forecasts (QPF's) issued 2-12 h earlier from the National Meteorological Center (NMC). Results show the accuracy of the OBJ forecasts was substantially better than the longer range NMC QPF's, particularly for the heavier amounts. The utility of the OBJ probability forecasts was also considered. The probabilities exhibit good statistical reliability, particularly where sample sizes are adequate. Also, several examples of very heavy rainstorms indicate the probabilities can be used to express confidence in the predicted isohyets and to assess the overall magnitude of the precipitation event. It is concluded that the isohyetical OBJ forecasts are a useful update of other centralized QPF's and that the probabilities add a useful measure of confidence to the predicted isohyets. CASE STUDY EVALUATION OF SATELLITE-DERIVED RAINFALL ESTIMATES AND THEIR APPLICATION TO NUMERICAL MODEL PRECIPITATION FORECAST VERIFICATION.
National Weather Service Forecast Office, Milwaukee, WI.
G. A. Field.
Available from the National Technical Information Service, Springfield, VA 22161, as PB89-194591/AS. Price codes: A05 in paper copy, A01 in microfiche. May 1989. 77p, 32 fig, 4 tab, 50 ref.

Descriptors: *Climatology, *Meteorology, *Precipitation mapping, *Satellite technology, *Weather forecasting, Model studies, Performance evaluation, Verification studies.

Satellite-derived precipitation estimates are computed and then evaluated using a dense network of cooperative observer rain gage reports as the verification. The satellite rainfall estimates are produced every half hour for the 24-hour period starting 1200 GMT, July 20, 1981. They are computed using the operational Scofield-Oliver Convective Rainfall Estimation Technique on the University of Wisconsin's Man-Computer Interactive Data Access System (McIDAS). The McIDAS analysis procedure provides estimate values assigned to grid points spaced 22 km apart. The rainfall observations, however, are at irregularly located positions. In order to be able to objectively evaluate the estimates, the observations are interpolated to the same grid points as the estimates using a minimum of smoothing. Difference fields then are evaluated. The numerical model evaluated is an Australian mesoscale model referred to as the Subsynoptic Scale Model (SSM). The results show that the satellite estimates compare very favorably with the observations, especially with regard to location of rainfall maxima. It is shown that the orientation of the maxima and minima axes in the contoured estimate field is in good agreement with the observations and radar reports. As would be expected, this agreement improves with higher amounts of smoothing. Some displacement errors are observed and it is shown how small location errors can lead to large errors in a gridded difference field. By using satellite estimates as part of the SSM model verification, this study suggests a new application for the use of the Scofield-Oliver technique. Unfortunately, the SSM model fails to accurately predict convective precipitation in this case study. It's forecast precipitation area is too far to the north and the amounts are much too small. Nevertheless, the feasibility of using satellite estimates to verify the model is demonstrated. It is shown that the potential exists for operational numerical (mesoscale) modeling to benefit by having such satellite verification information for precipitation which can be produced in near real-time. DETERMINATION OF AN UPPER LIMIT DESIGN RAINSTORM FOR THE COLORADO RIVER BASIN ABOVE HOOVER DAM.
Morrison-Knudsen Engineers, Inc., Denver, CO.
Available from the National Technical Information Service, Springfield, VA. 22161 as PB91-104562. Price codes: A07 in paper copy, A07 in microfiche. September 1990. 129p, 82 fig, 30 tab, 44 ref, 2 append. Bureau of Reclamation Contract 5-CA-30-02880.

Descriptors: *Colorado River Basin, *Data interpretation, *Design storms, *Model studies, *Rainfall forecasting, *Rainfall rate, *Rainfall-runoff relationships, Computer programs, Glen Canyon Dam, Hoover Dam, Meteorology, Net rainfall, Orographic precipitation, Rainfall area, Simulated rainfall, Spatial distribution, Temporal distribution, Topography.

Storms over the Southern Intermountain Region were reviewed to determine the cause of large rainfall amounts for the May through October season. Rainfall amounts from the largest storms were analyzed using a Bureau of Reclamation mini-storm computer program to determine DAD (depth-area-duration) values. These DAD data formed the basis for the development of the magnitude of the ULDRS (Upper Limit Design Rain Storm) for the Colorado River Basin above Hoover Dam. For this basin, rainfall magnitude is influenced by topography, and an ULDRS magnitude is required for each storm centering. Review of the data from storms indicated that one storm centering on the San Juan Mountains was characteristic for the basin above Glen Canyon Dam. A storm centering on the Pine and Cedar Mountains was characteristic of the basin between Hoover and Glen Canyon Dams. The ULDRS magnitude was determined for these two locations with individual storm spatial and temporal distributions provided. The magnitude and time interval required for storms to recur at these locations was needed. Review of large storms over the basin indicated an interstorm interval increasing from 7 days in midsummer and fall to more than 10 days in the spring would permit the ULDRS to recur. Lesser events could occur with lesser time intervals. (Author's abstract)

TEMPORAL CHANGES IN HEAVY RAINFALL FREQUENCIES IN THE GREAT LAKES BASIN.
Illinois State Water Survey Div., Champaign.
F. Huff, and J. Angel.
IN: The Great Lakes: Living with North America's Inland Waters. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1988. p 129-135, 4 fig, 3 tab, 6 ref.

Descriptors: *Great Lakes, *Illinois, *Lake management, *Rainfall distribution, *Water level fluctuations, *Water resources management, Climatic changes, Frequency analysis, Frequency distribution, Indiana, Lake Michigan, Michigan, Rainfall intensity, Spatial analysis, Wisconsin.

Analyses of heavy rainstorm data from 61 stations in Illinois during 1901-80 have indicated an increasing trend in the frequency distribution of heavy storms over most of the state since 1940. The increase has been most pronounced in northeast Illinois which borders on Lake Michigan. Evidence of a climatic fluctuation, exhibiting trends upward in the north and downward in the southern part of Illinois, was most evident in the comparison of frequency distributions derived from two 40-year samples and supported considerably by the 20-year trend analyses. Preliminary findings for other lake-bordering states indicate the Illinois high extends across the lake into southwest Michigan, eastward into northwest Indiana, and northward into southern and southeast Wisconsin. Thus, there is continuity in spatial patterns indicated, and a substantial increase in the frequency and intensity of heavy rainstorms is indicated in some portions of the lake-bordering states. These increases appear to be greater than expected from natural climatic variability, and sufficiently large to have implications in water structure designs. (See also W91-03672) (Author's abstract)

STOCHASTIC MODEL OF THE INTERNAL STRUCTURE OF CONVECTIVE PRECIPITATION IN TIME AT A RAINGAUGE SITE.
Universidad Politecnica de Valencia (Spain). Dept. of Hydraulic and Environmental Engineering.
R. Garcia-Bartual, and J. Marco.
Journal of Hydrology JHYDA7, Vol. 118, No. 1/4, p 129-142, October 1990. 9 fig, 2 tab, 14 ref.

Descriptors: *Convective precipitation, *Hydrologic models, *Model studies, *Precipitation, *Rainfall intensity, *Statistics, *Stochastic models, *Storms, *Time series analysis, Algorithms, Probable maximum precipitation, Rain gages, Spain, Synthetic hydrology.

Analyses of stochastic structures of precipitation usually center on two distinct problems, the internal and external structures. Internal structure concerns the within-the-storm intensity, while external structure analyzes sequences of precipitation storms. Hyetographs of extreme convective precipitation were modeled in terms of a marked finite point process of convective cell arrivals, each point or occurrence in time representing the birth of a cell. Rain intensity resulting from the activity of each of these cells is assumed to have a gamma-type function shape with peak intensity and volume being random variables. The model has been tested with data from maximum storms during the period 1940-1985 at two sites on the Mediterranean coast of Spain: Valencia and Alicante. The proposed temporal structure showed good agreement with the observed series at the smaller scales (increments of 10 min), and the most characteristic temporal patterns in internal structure of precipitation were adequately described. Simple generation algorithms according to this formulation allow generation of synthetic series. (Author's abstract)

SAMPLING ERRORS FOR RAINGAUGE-DERIVED MEAN AREAL DAILY AND MONTHLY RAINFALL.
Hydrological Research Inst., Pretoria (South Africa).
A. W. Seed, and G. L. Austin.
Journal of Hydrology JHYDA7, Vol. 118, No. 1/4, p 163-173, October 1990. 7 fig, 1 tab, 15 ref.

Descriptors: *Areal precipitation, *Convective precipitation, *Data interpretation, *Error analysis, *Meteorology, *Network design, *Rain gages, Meteorologic data, Parametric hydrology, Precision, Rainfall area, Variability.

The accuracy of rain gage derived mean areal rainfall needs to be understood before gage data can be used as ground truth for satellite and radar rainfall measuring systems. Radar data from two geographic locations were used to simulate the mean standard error in using a sparse rain gage network to estimate daily and monthly mean areal convective rainfall over areas ranging from 45,000 to 180,000 sq km. It was found that a network with a regular configuration gave somewhat less-variable errors than the random rain gage network, although the mean errors were very similar. The difference became more pronounced for the very sparse networks. The mean standard error for a particular network and rainfield was found to be a function of the number of gages in the network, the raining fraction of the area and the ratio of the standard deviation over the mean of the non-zero portion of the rainfield. A simple three-parameter relationship was proposed to relate the mean standard error, expressed as percentage of the mean areal rainfall, to these variables. It was found that a

single relationship was able to explain 63% of the variability in the estimated mean standard estimation error, combining data from both regions. Finally, the domain over which the relationship is able to make reasonable predictions is determined by the principle constraint of limiting the raining fraction of the area to 0.5 for networks with >200 rain gages. PARAMETER TRANSFERABILITY FOR A DAILY RAINFALL DISAGGREGATION MODEL.
National Weather Service, Johnson City, NY.
T. W. Econopouly, D. R. Davis, and D. A. Woolhiser.
Journal of Hydrology JHYDA7, Vol. 118, No. 1/4, p 209-228, October 1990. 6 fig, 11 tab, 13 ref.

Descriptors: *Climatology, *Hydrologic models, *Local precipitation, *Model studies, *Parametric hydrology, *Rainfall, *Statistical analysis, Data interpretation, Rain gages, Simulation analysis, Stochastic models.

Methods that use readily-available daily rainfall data to stochastically simulate short-time period rainfall have been developed. At least two methods of disaggregating daily rainfall into shorter time periods exist in the literature: the discrete-discrete (D-D) and the discrete-continuous (D-C). The D-C method disaggregates the discrete daily rainfall process into a continuous process of wet periods (showers) and dry periods within a day, and appears to require fewer parameters than the D-D process. The D-C model was modified and applied to data from two midwestern stations in the U.S. Statistical tests indicate that the number of showers, the start times, shower depths, and shower durations of simulated sequences compare favorably with observed sequences, and that the disaggregation model parameters identified at one gage provide a satisfactory fit for three test stations up to 470 km away, provided the test stations are in the same climatological region. INFLUENCE OF MOUNTAINS ON LARGE-SCALE PRECIPITATION: A DETERMINISTIC APPROACH TOWARDS OROGRAPHIC PMP.
Vienna Univ. (Austria). Inst. fuer Meteorologie und Geophysik.
T. Haiden, P. Kahlig, M. Kerschbaum, and F. Nobilis.
Hydrological Sciences Journal HSJODN, Vol. 35, No. 5, p 501-510, October 1990. 5 fig, 1 tab, 18 ref.

Descriptors: *Areal precipitation, *Meteorology, *Mountains, *Orographic precipitation, *Probable maximum precipitation, *Rainfall forecasting, Austria, Cloud physics, Mathematical analysis, Mathematical models, Precipitation rate.

Probable maximum precipitation (PMP) is the greatest depth of precipitation for a given duration meteorologically possible for a given size storm area at a particular location at a particular time of the year. This definition points to the importance of taking into account the synoptic and orographic boundary conditions for investigations of PMP. A physical approach was chosen to estimate orographic precipitation. Based on a balance equation for cloud water and on a kinematic model of air flow over mountains, the distribution of cloud water and precipitation rate is calculated for specified (but arbitrary) inflow conditions and orography. In contrast to comparable models in which the whole condensed water falls out, cloud physical parameters control the efficiency of precipitation formation. These results which concern the problems of precipitation enhancement by terrain-induced vertical motion are a first step toward new considerations regarding Probable Maximum Floods. For an alpine country like Austria, the development of a hierarchy of concepts, using deterministic model physics and a digital terrain representation, appear appropriate. A comparison of model results with observations using inflow data from measurements during actual precipitation episodes in Austria revealed basic similarities between observed patterns and the main structure of the simulated distribution. The basic features of the model are consistent extensions of WMO recommendations. (Hoskin-PTT)

COMPARISON OF OBJECTIVE AND SUBJECTIVE PRECIPITATION PROBABILITY FORECASTS: THE SUFFICIENCY RELATION.
Oregon State Univ., Corvallis. Dept. of Atmospheric Sciences.
A. H. Murphy, and Q. Ye.
Monthly Weather Review MWREAB, Vol. 118, No. 9, p 1783-1792, September 1990. 8 fig, 2 tab, 20 ref. NSF Grant ATM-8714108.

Descriptors: *Data interpretation, *Forecasting, *Meteorology, *Precipitation, *Precipitation forecasting, *Rainfall forecasting, *Weather forecasting, Comparison studies, Mathematical analysis, Probabilistic process.

The sufficiency relation is used to compare objective and subjective probability of precipitation (PoP) forecasts. The theoretical significance of the sufficiency relation in comparative evaluation arises from the fact that if it can be shown that forecasting system A is sufficient for forecasting system B, then A's forecasts are necessarily of higher quality and greater value to all users than B's forecasts. However, since the sufficiency relation is an incomplete order, the practical significance of this relation warrants further investigation. An operational method of comparing forecasting systems using the sufficiency relation has recently been described in the forecasting literature. This method involves the construction of a so-called forecast sufficiency characteristic (FSC) for each forecasting system, based on a representative set of forecasts and observations. In terms of this characterization, system A is sufficient for system B if A's FSC is superior to B's FSC. Objective and subjective PoP forecasts for six National Weather Service offices are compared in terms of their respective FSCs. Sufficiency was found in only two of the 24 cases defined by various combinations of forecast office, season, and lead time. In these two cases, both involving 12-24 hour forecasts, the subjective forecasts were sufficient for the objective forecasts. Several other cases exhibited a condition described as 'almost sufficient', but caution must be exercised in drawing conclusions regarding the relative quality and/or relative value of forecasts in such cases. Comparison of the FSCs of PoP forecasts and the FSCs of categorical forecasts derived from the PoP forecasts reveals that, as expected, the former are always superior to the latter. Water Resources Bulletin WARBAQ, Vol. 26, No. 4, p 633-643, August 1990. 11 fig, 1 tab, 18 ref.

Descriptors: *Air pollution effects, *Climatic changes, *Climatology, *Global warming, *Moisture index, *Precipitation, *Thornthwaite Moisture Index, *United States, Atmospheric chemistry, Atmospheric circulation, Carbon dioxide, Evapotranspiration, Meteorology, Model studies, Temperature effects.

The Thornthwaite moisture index is a useful indicator of the supply of water (precipitation) in an area relative to the demand for water under prevailing climatic conditions (potential evapotranspiration). The study examines the effects of changes in climate (temperature and precipitation) on the Thornthwaite moisture index in the conterminous United States. Estimates of changes in mean annual temperature and precipitation for double-atmospheric CO2 conditions derived from three general circulation models (GCMs) are used to study the response of the moisture index under steady-state doubled-CO2 conditions. Results indicate that temperature and precipitation changes under doubled-CO2 conditions generally will cause the Thornthwaite moisture index to decrease, implying a drier climate for most of the United States. The pattern of expected decrease is consistent among the three GCMs, although the amount of decrease depends on which GCM climatic-change scenario is used. Results also suggest that changes in the moisture index are related mainly to changes in the mean annual potential evapotranspiration as a result of changes in the mean annual temperature, rather than to changes in the mean annual precipitation. COMPUTER SIMULATION OF ICE CONTROL WITH THERMAL-BUBBLE PLUMES: LINE SOURCE CONFIGURATION.
University of Western Ontario, London. Dept. of Civil Engineering.
R. E. Baddour.
Canadian Journal of Civil Engineering CJCEB8, Vol. 17, No. 4, p 509-513, August 1990. 8 fig, 19 ref.

Descriptors: *Channel maintenance, *Computer models, *Ice breakup, *Ice control, *Simulation analysis, Bubbles, Costs, Navigation channels, Obstructions to navigation, Thermal stratification.

Thermal-bubble plumes in a freshwater environment were studied to determine their ice control capabilities. A computer model was developed to optimize the operation of thermal-bubble installations when designed to control ice. Steady-state ice control simulations would be useful in determining feasible warm water-air combinations required to achieve a specified degree of ice control to maintain navigation channels. The availability and cost of providing warm water and air at the site would ultimately determine the optimal solution. It would generally be more economical to design a system to suppress ice growth and maintain a manageable thickness of ice, than to achieve large, fully open water conditions all the time. Warm water supply may not be required when natural stratification is present or during periods of mild weather. Transient ice control was simulated for the thermal bubbler and a regular bubbler for a 30 day period. The thermal bubbler gave superior ice control in the simulation analysis. Thermal bubble technology may also be applied to thermal and other industrial and municipal discharges into natural water bodies. (Geiger-PTT)

HEAT AND MASS BALANCE OF AN ABLATING ICE JAM.
National Hydrology Research Inst., Saskatoon (Saskatchewan). Northern Hydrology Section.
T. D. Prowse.
Canadian Journal of Civil Engineering CJCEB8, Vol. 17, No. 4, p 629-635, August 1990. 5 fig, 1 tab, 7 ref.

Descriptors: *Ablation, *Heat budget, *Ice breakup, *Ice jams, *Mathematical studies, Energy, Flood forecasting, Melting, Porosity, Rivers, Theoretical analysis, Water temperature.

The heat and mass balance of an ablating ice jam at the confluence of the Liard and Mackenzie rivers in the spring of 1983 was examined. From May 6 to May 9, sufficient data were collected to determine the magnitude and relative importance of the major heat fluxes that caused thermal decay of the ice jam. The total atmospheric heat input of 125 million MJ and the much larger contribution from hydrothermal sources of 980 million MJ resulted in a total melt of 32.4 million cu m of ice within the jam. These data in combination with previous results regarding jam dimensions permitted calculation of ice jam porosity, a variable frequently used in hydraulic studies of river ice jams although unverified by field data. The largest potential error in the calculations was related to the accuracy of water temperature measurement. Accounting for this resulted in an estimate of porosity of 0.38 + or -10% which lends credence to the commonly assumed value of 0.40. (Author's abstract)

HEAVY MESOSCALE SNOWFALL EVENT IN NORTHERN GERMANY.
W. S. Pike.
Meteorological Magazine MTMGA5, Vol. 119, No. 1418, p 187-195, September 1990. 9 fig, 10 ref.

Descriptors: *Germany, *Meteorology, *Precipitation, *Snow, *Snow accumulation, *Storms, Air masses, Cyclones, Eddies, Hamburg, Local precipitation, Vortices, Weather, Weather patterns.

The geographical extent and particular causes of localized heavy snowfalls which occurred near southwest Baltic Sea coasts on the night of 11-12 January 1987 were investigated. A heavy snowfall of between 20 and 70 cm occurred in a 16-hr period along a narrow, sharply defined belt which was, geographically, an extension of the southern Mecklenburg Bight coastline downwind to the west-southwest towards southeastern Hamburg. The orientation of the coastline presented a shallow angle to the onshore wind which was extremely favorable for continuing coastal convergence and uplift between (1) a strong, moist, showery northeasterly airflow over the sea, with air temperatures typically -6 to -10 C, and (2) stagnating, colder overland air near -20 C. A well marked coastal front was formed between the two airflows. The formation of small Baltic Sea warm cyclones intensified the snowfall from time to time, in association with smaller eddy-vortices. The steep cliffs of Rugen Island also provide a natural topographic division of a cold northeasterly airstream, downwind of which the coastal convergence line is likely to form long a marked boundary between fast-flowing and slow-flowing airstreams at low levels. TRACING THE ORIGIN OF NATURAL WATERS IN A GLACIAL TILL SLOPE DURING SNOWMELT.
Royal Inst. of Tech., Stockholm (Sweden). Dept. of Land and Water Resources.
B. Espeby.
Journal of Hydrology JHYDA7, Vol. 118, No. 1/4, p 107-127, October 1990. 6 fig, 46 ref.

Descriptors: *Flow discharge, *Groundwater movement, *Isotopic tracers, *Oxygen isotopes, *Snowmelt, *Soil water, *Tracers, Chemical properties, Frozen ground, Interstitial water, Iodides, Leaching, Roots, Snow cover, Surface-groundwater relations, Sweden, Vadose zone, Water chemistry.

A study of the origin of water sampled at a set of sampling points in the discharging area of a sloping forested glacial till in Sweden, was performed during the two snowmelts of 1966 and 1987. Analyses of a limited number of chemical components and the oxygen-18 (O-18) content were performed of the sampled water from the snowmelt of 1986. A tracer experiment was performed during the snowmelt of 1987, when potassium iodide was sprayed on top of the snow cover at two surfaces in the discharging area of the slope. The results from both snowmelt studies indicate that macropore channels of old root remains can conduct water rapidly through an unsaturated and frozen matrix without displacing the soil-bound water. Alkalinity and pH values of the macropore water were similar to the snow cores. Even the deeper groundwater from a spring site was affected by the acid surge during the peak snowmelt of 1986, proving that macrostructures present in the till were promoting preferential water movement through the soil matrix. The surge was also detected with the O-18 technique but was not as pronounced as in the values of the chemical components. The tracer experiment gave these results despite the large amount of tracer that was retained in the unsaturated soil matrix. One very important conclusion from this experiment is that iodide should be injected below the humus and the leaching horizons of podsols in order to get good saturated conditions and thereby prevent retention in the matrix. HYDRAULIC PROPERTIES IN AN OPERATIONAL MODEL OF FROZEN SOIL.
Uppsala Univ. (Sweden). Naturgeografiska Inst.
L. C. Lundin.
Journal of Hydrology JHYDA7, Vol. 118, No. 1/4, p 289-310, October 1990. 10 fig, 1 tab, 42 ref.

Descriptors: *Frost, *Frozen ground, *Model studies, *Soil physical properties, *Soil water, Clays, Freezing, Hydraulic conductivity, Ice lenses, Impedance, Interstitial water, Loam, Soil moisture retention, Soil structure, Soil temperature.

Many current models of heat and water flow in frozen soils overestimate the freezing-induced redistribution of water. These models also treat the soil physical properties as constant in time although they are strongly influenced by the frost itself. A study was conducted to determine possible methods to overcome these two problems in an operational hydraulic model. Winter measurements of soil temperature and water content were performed on a clay soil and on a layered loam soil. The data were compared with simulations made with a physically-based, one-dimensional model of coupled heat and water flow. Two procedures were tested for the calculation of hydraulic conductivity of partially frozen soil: firstly, an interpolation procedure, taking into account the strong nonlinearity of the hydraulic conductivity function close to the freezing front. Secondly, an impedance parameter was used to describe the effect of ice lenses. A spring time modification of the soil moisture characteristic curve was tested to account for the frost-induced changes of the soil structure. Simulated temperatures and water contents agreed well with measurements, both for the clay and the layered loam soil, after introduction of the impedance parameter. The alternative procedure did not only reduce the hydraulic conductivity of the frozen soil sufficiently to produce a realistic redistribution, but also enabled use of a lower value on the impedance parameter. Changes in water retention properties resulting from frost action during winter caused an overestimation of simulated water content of 15% by volume in the heavy clay soil during spring. This discrepancy was eliminated by increasing the frequency of pore diameters below 0.1 mm in the model during spring. (Author's abstract)

DYNAMICS AND ORIGIN OF SALINE SOILS ON THE SLIMS RIVER DELTA, KLUANE NATIONAL PARK, YUKON TERRITORY.
Calgary Univ. (Alberta). Dept. of Geography.
S. A. Harris.
Arctic ATICAB, Vol. 43, No. 2, p 159-175, June 1990. 13 fig, 12 tab, 67 ref, append.

Descriptors: *Deltas, *Frost, *Frozen soils, *Geochemistry, *Permafrost, *Saline soils, *Slims River, *Soil chemistry, *Yukon, Alaska, Leaching, Salinity, Seasonal variation, Snowmelt, Sulfates.

The saline soils of the Slims River Delta have developed on land formed in the last 100 years in an area of otherwise continuous permafrost. Deep seasonal frost on the delta prevents the downward leaching of salts when the snow melts. Instead, the salts accumulate at the surface as the ground dries, while additional salts are added from springs at the base of the surrounding mountains. Late summer rains can leach the soils if they are sufficiently heavy, producing a 3 to 4 fold variation in salinity from year to year. The efflorescences are dominated by the hexahydrate of magnesium sulfate, and the high sulfate content is probably the reason that soils in depressions with the morphology of solonetzic soils remain reasonably friable. The distribution of the characteristic halophytic plant association found on these soils appears to be controlled more by soil moisture content than by actual salinity level. (Author's abstract)

Evaporation experiments from sand columns with restricted and unrestricted water tables were carried out to elucidate the mechanism of evaporation from bare land. Turbulent airflow was applied to the exposed surface layer. The transient development of the deuterium composition of liquid water in the sand columns was measured by a microdistillation technique during the experiments. Turbulent airflow affected the evaporative process of water vapor transfer and the deuterium distribution at relatively shallow depths in the columns. The attainment of a steady evaporation rate and deuterium profile was not obtained in either the restricted or unrestricted water table cases until significant time had elapsed. In the unrestricted water table case, the transient processes of evaporation rate, depth of the evaporation front, water table depth and the development of the deuterium concentration profile show a characteristic behavior that may be described by a similarity solution for part of the experimental duration. Significant enrichment of deuterium occurs in the liquid-vapor region and at the upper zone of the liquid region with time. The isotopic enrichment does not affect the physical process of evaporation of liquid water. Information on the transient development of the deuterium concentration profile is very useful for understanding the nature of liquid water and water vapor movement in the columns, and estimation of the depth of the evaporating front is an important index in bare land evaporation. Daily variation of the isotopic composition, both deuterium and oxygen-18, of water in foliage of a mixed eucalyptus 'mallee' community was studied in relation to the isotopic composition of soil water and atmospheric water vapor, transpiration and evapotranspiration, and environmental conditions. The isotopic composition of water in foliage and the soil surface were enriched over adjacent stem and deeper soil water respectively, characteristic of water subject to evaporation. The composition of foliar water varied systematically over the day, being highest in the late afternoon, in response to lower relative humidity. The foliar water composition fitted a steady-state model of leaf water fractionation. It was found that the fraction of leaf water equilibrated with the atmosphere was at a minimum during the middle of the day, fitting earlier observations. The equilibrated fraction was relatively high compared with previous transpiration studies. The soil water isotope-depth profiles had not achieved steady state. Using existing models, we conclude that the foliage and soil compartments are exchanging water vapor, but that some complicated evaporation processes are occurring in the soil, probably as a result of daily temperature cycling. Examining the relationship of the two isotope tracers in the different compartments, the vapor transport fits a transport model in which it is strongly diffusion-limited, both within the soil and leaf. Because of some uncertainty as to the transport mechanisms involved, it is not clear what the relative contributions from soil and foliage are. The vegetation may be having a considerable influence on the total evaporation from the community, since the effects of the root system on the soil structure and soil water transport are not clear. WATER BALANCE OF SNOW TUSSOCK GRASSLAND IN NEW ZEALAND.
Otago Univ., Dunedin (New Zealand). Dept. of Geography.
D. I. Campbell, and D. L. Murray.
Journal of Hydrology JHYDA7, Vol. 118, No. 1/4, p 229-245, October 1990. 8 fig, 4 tab, 18 ref.

Descriptors: *Evapotranspiration, *Grasslands, *Hydrologic budget, *New Zealand, *Vegetation effects, *Water yield, Clouds, Drainage, Evaporation, Fog, Forests, Interception loss, Leaves, Lysimeters, Pastures, Precipitation, Rainfall, Storage capacity, Storms, Transpiration, Watersheds.

The water relations of snow tussock grassland have been debated for many years although there are no published catchment comparisons of pasture and tussock vegetation. Measurements of rainfall, drainage, and weight change of a 6-sq-m surface area cylindrical lysimeter containing nine snow tussocks, were combined in a simple water balance equation to calculate evaporation on an hourly basis for 16 months in Otago, New Zealand. For most of the period it was possible to distinguish evaporation from dry foliage (transpiration), and wet canopy evaporation (interception loss), on the basis of leaf wetness. Mean daily transpiration rates ranged from 0.55 mm/day in June to 3.32 mm/day in January; intercepted water evaporated at a median rate of 0.04 mm/h in winter and on summer nights, and 0.08 mm/h during daylight in summer. Interception storage capacity is about 0.5 mm but relative interception losses are high when there are many small rain events. Horizontal interception of water from fog or cloud contributed about 1% of precipitation for the period examined. For the April-March year, total evaporation was 622 mm and transpiration exceeded interception loss in each month. Annual interception loss was 222 mm, or 21.3% of the total precipitation of 1042 mm. Monthly interception loss varied between 10% and 45% of precipitation and was very dependent on storm size and frequency. Snow tussock may be the optimal vegetation for water yield in this environment: transpiration rates are lower than for pasture and interception losses are less than for forests. (Author's abstract)

TRAVELTIME AND REAERATION COEFFICIENTS FOR THE NORTH PLATTE RIVER, CASPER TO ORIN, WYOMING.
Geological Survey, Cheyenne, WY. Water Resources Div.
J. G. Rankl, and M. A. Carnevale.
Available from WY Dept. Environmental Quality; Herschler Bldg., Cheyenne, WY 82002. Wyoming Department of Environmental Quality, Cheyenne, State Cooperative Report, 1989. 34p, 11 fig, 6 tab, 24 ref. Project no. WY090.

Descriptors: *Dye dispersion, *Flow velocity, *North Platte River, *Path of pollutants, *Reaeration, *Streamflow data, *Tracers, *Traveltime, *Wyoming, Dye concentrations, Flow duration, Flow rates.

The opportunities for accidental spills of hazardous wastes into the North Platte River between Casper and Orin, Wyoming, are numerous. Highways, railroads, and pipelines cross and parallel the North Platte River. Treated wastewater from cities, industries, and refineries is discharged to the river. The report describes the movement in water of materials that may be spilled or discharged into the North Platte River. Traveltime and dispersion measurements were made on the North Platte River between Casper and Orin at discharges of 800, 890, and 3,100 cu ft/sec. The rate of movement of soluble material spilled or discharged into the North Platte River can be estimated from graphs developed from the four traveltime measurements. The following traveltime characteristics were developed: traveltime of the center of the tracer cloud as a function of stream discharge, velocity of the leading edge and peak concentration of the tracer cloud in relation to stream discharge, tracer-cloud passage time in relation to distance, and unit-peak concentration as a function of traveltime. On the basis of gas-tracer and dye-tracer data for a stream discharge of 800 cu ft/sec, reaeration coefficients were measured for three reaches of the North Platte River. Measured reaeration coefficients ranged from 4.85 to 6.70/day at 20 C, in base-e logarithm units. Reaeration coefficients computed from empirical equations were compared to reaeration coefficient measured in this study. (USGS)

BASIN CHARACTERISTICS, HISTORY OF STREAM GAGING, AND STATISTICAL SUMMARY OF SELECTED STREAMFLOW RECORDS FOR THE RAPID CREEK BASIN, WESTERN SOUTH DAKOTA.
Geological Survey, Rapid City, SD. Water Resources Div.
D. G. Driscoll, and J. S. Zogorski.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 90-120, 1990. 147p, 29 fig, 75 tab, 22 ref.

Descriptors: *Rapid Creek Basin, *South Dakota, *Stream gaging, *Surface water data, *Surface-groundwater relations, Basin characteristics.

The report presents a summary of basin characteristics affecting streamflow, a history of the U.S. Geological Survey's stream-gaging program, and a compilation of discharge records and statistical summaries for selected sites within the Rapid Creek basin. It is the first in a series which will investigate surface-water/groundwater relations along Rapid Creek. The summary of basin characteristics includes descriptions of the geology and hydrogeology, physiography and climate, land use and vegetation, reservoirs, and water use within the basin. A recounting of the U.S. Geological Survey's stream-gaging program and a tabulation of historic stream-gaging stations within the basin are furnished. A compilation of monthly and annual mean discharge values for nine currently operated, long-term, continuous-record, streamflow-gaging stations on Rapid Creek is presented. The statistical summary for each site includes summary statistics on monthly and annual mean values,

correlation matrix for monthly values, serial correlation for 1 year lag for monthly values, percentile rankings for monthly and annual mean values, low and high value tables, duration curves, and peak-discharge tables. Records of monthend contents for two reservoirs within the basin also are presented. (USGS)

TIME OF TRAVEL OF SOLUTES IN THE TRINITY RIVER FROM DALLAS TO TRINIDAD, TEXAS, MAY AND AUGUST 1987.
Geological Survey, Austin, TX. Water Resources Div.
W. S. Gain.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 89-614, 1990. 1 sheet, 3 fig, 1 tab, 4 ref.

Descriptors: *Dye releases, *Solute transport, *Texas, *Tracers, *Traveltime, *Trinity River, Dye tracing, Fluorometry, Path of pollutants, Solutes.

A study of the time-of-travel of solutes in a reach of the Trinity River from Dallas to Trinidad, Texas, was conducted in May and August 1987 using 20% Rhodamine WT dye and fluorometry. Two injections of dye were made--one in each of two subreaches--and tracked at several locations downstream. Discharges on the river ranged from 700 to 1,160 cu ft/sec. Traveltime data are presented with a map of the study reach, dye-concentration plots, and traveltime versus distance plots. The mean velocity of the concentration peak for the upper subreach was 1.18 ft/sec. The mean peak velocity for the lower subreach was 1.02 ft/sec. (USGS)
W91-02969

TECHNIQUES FOR ESTIMATING FLOOD-PEAK DISCHARGES OF RURAL, UNREGULATED STREAMS IN OHIO.
Geological Survey, Columbus, OH. Water Resources Div.
G. Koltun, and J. W. Roberts.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4126, 1990. 68p, 3 fig, 23 ref.

Descriptors: *Flood peak, *Ohio, *Rainfall-runoff relationships, *Rural areas, Estimating equations, Log-Pearson analysis, Statistical methods.

Multiple-regression equations are presented for estimating flood-peak discharges having recurrence intervals of 2, 5, 10, 25, 50, and 100 years at ungaged sites on rural, unregulated streams in Ohio. The average standard errors of prediction for the equations range from 33.4% to 41.4%. Peak discharge estimates determined by log-Pearson Type III analysis using data collected through the 1987 water year are reported for 275 streamflow-gaging stations. Ordinary least-squares multiple-regression techniques were used to divide the State into three regions and to identify a set of basin characteristics that help explain station-to-station variation in the log-Pearson estimates. Contributing drainage area, main-channel slope, and storage area were identified as suitable explanatory variables. Generalized least-square procedures, which include historical flow data and account for differences in the variance of flows at different gaging stations, spatial correlation among gaging station records, and variable lengths of station record were used to estimate the regression parameters. Weighted peak-discharge estimates computed as a function of the log-Pearson Type III and regression estimates are reported for each station. A method is provided to adjust regression estimates for ungaged sites by use of weighted and regression estimates for a gaged site located on the same stream. Limitations and shortcomings cited in an earlier report on the magnitude and frequency of floods in Ohio are addressed in this study. Geographic bias is no longer evident for the Maumee River basin of northwestern Ohio. No bias is found to be associated with the forested-area characteristic for the range used in the regression analysis (0.0 to 99.0%), nor is this characteristic significant in explaining peak discharges. Surface-mined area likewise is not significant in explaining peak discharges, and the regression equations are not biased when applied to basins having approximately 30% or less surface-mined area. Analyses of residuals indicate that the equations tend to overestimate flood-peak discharges for basins having approximately 30% or more surface-mined area. (USGS)

WATER RESOURCES OF THE ELK RIVER BASIN, WEST VIRGINIA.
West Virginia Dept. of Natural Resources, Charleston. Div. of Water Resources.
M. V. Mathes, and S. M. Ward.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. West Virginia Dept of Natural Resources, Division of Water Resources, River Basin Bulletin 6, 1990. 37p, 17 fig, 37 ref.

Descriptors: *Hydrogeology, *Water resources data, *West Virginia, Elk River basin, Groundwater, Groundwater quality, Land use, Streamflow, Water quality, Well yield.

The Elk River basin is located in central West Virginia and drains 1,533 sq mi. The water resources of the Elk River basin are used by 12% of the population of West Virginia. In 1984, more than 9 billion gallons of water were withdrawn from the basin. The mean annual outflow of the Elk River is about 2,300 cu ft/sec, which is equivalent to 21 in of runoff. Streamflow in the lower reaches of the Elk River is regulated by Sutton Reservoir, which decreases the magnitude of flood peaks and augments low flow. Surface water in the Elk River and its major tributaries is poorly buffered and susceptible to acidification. Concentrations of dissolved iron, chloride, and manganese exceeded State water quality standards at some sites. Groundwater quality varies with respect to topography and hydrogeologic unit. Wells on hilltops yielded water with greater hardness, lower pH, lower iron concentrations, and higher hardness and sulfate concentrations than did wells in valleys. Water from the Pottsville Group in aquifers in the Lower Pennsylvanian rocks was softer, more acidic, and had a higher concentration of dissolved iron and manganese than water from other hydrogeologic units. Water from the Conemaugh Group in aquifers in the Upper Pennsylvanian rocks was the most mineralized. Reported well yields ranged from 0.08 to 1,000 gallons/min and were greater for wells in valleys than wells on hillsides or hilltops. (USGS)

PARTIAL AREA CONCEPT AND ITS APPLICATION TO THE PROBLEM OF SEDIMENT SOURCE AREAS.
Alberta Univ., Edmonton. Dept. of Geography.
I. A. Campbell.
IN: Soil Erosion and Conservation. Soil Conservation Society of America, Ankeny, Iowa. 1985. p 128-138, 70 ref.

Descriptors: *North Carolina, *Partial area runoff, *Rainfall-runoff relationships, *Sediment sources, *Soil erosion, *Tennessee, Catchment basins, Comparison studies, Overland flow, Storm runoff, Water pollution sources.

It is now recognized that the partial area concept is a more broadly applicable way to view runoff generation than the Hortonian overland flow approach. However, the linkage between partial area runoff and sediment source areas has not been described widely in the literature on sediment production and yield nor has it been extensively investigated in the field. Runoff and sediment yield patterns and processes have been treated largely as separate components, if not as independent processes. Application of the partial area concept to overland flow leads to the conclusion that runoff in almost all cases will be generated from an area much smaller than the total basin area. Studies in North Carolina and Tennessee showed that no more than 40% of the basin surface areas typically contributed to even heavy storm runoff and some basins, on average, contributed runoff from only 4.6% of their area. This general principle seems to hold in studies conducted on very large river basins as well, such as the Nile and Yellow River (China). Unfortunately, most published data do not reveal the relationships because the required detailed observations are not available. The implications of the partial area concept are that most methods of working with sediment source and yield data are inadequate and largely unrealistic. If small areas of basins are contributing most or nearly all of the runoff and sediment yield measured at the basin mouth, serious misconceptions will result about processes operating in the watershed if basinwide averaging techniques are used. The extension of these techniques to determine regional or global erosion rates is at best a simplistic speculative exercise. (See also W91-03117) (Rochester-PTT)

EXPERIMENTAL DATA ON RUNOFF GENERATION.
Katholieke Univ. Leuven (Belgium). Lab. voor Experimentele Geomorfologie.
J. De Ploey.
IN: Soil Erosion and Conservation. Soil Conservation Society of America, Ankeny, Iowa. 1985. p 528-539, 4 fig, 28 ref.

Descriptors: *Belgium, *Rainfall-runoff relationships, *Roughness, *Runoff, *Soil erosion, *Soil physical properties, Overland flow, Sheet erosion, Soil surfaces, Soil types, Surface sealing.

In recent years the Laboratory for Experimental Geomorphology in Leuven, Belgium, has focused part of its research on problems dealing with runoff generation. Several runoff threshold conditions on sandy and loamy topsoils, either bare sediments or cropland, and slopes with a steppe vegetation are discussed here. Results from throughout the world are reviewed as they apply to runoff generation and topsoil conditions; roughness elements, stemflow, and runoff generation; and the time to runoff (Tr). Progress in understanding of runoff generation will depend largely on improvement of current techniques and development of advanced techniques to follow changing topsoil conditions during rainfall. Particular attention must be paid to the ambivalent effects of several factors (e.g., roughness elements that control runoff events). Laboratory experiments will be fundamental for elucidating specific mechanisms of runoff generation. The factors in runoff promotion considered here would at first seem to enhance soil erosion, but they can have ambivalent impact on erodibility of topsoils, especially on slopes of low declivity. Roughness elements, if their cover density exceeds a certain critical value, also may protect against erosion. Sealing and crusting, by increasing topsoil smoothness, reduce the resistance to runoff flow. They therefore may reduce topsoil erodibility. This effect is limited to sheetwash, but it helps explain why erosion rates decrease with time on smooth interrill areas under constant flow conditions. (See also W91-03117) (Rochester-PTT)

RIVER MEANDERING.
Water Resources Monograph 12. American Geophysical Union, Washington. 1989. 485p. Edited by Syunsuke Ikeda, and Gary Parker.

Descriptors: *Channel flow, *Channel morphology, *Geomorphology, *Meanders, *River beds, *River flow, *Sediment transport, Mathematical models, Model studies, Shear stress, Theoretical analysis, Topography.

This monograph is an overview of research undertaken by five Japanese and five Americans of various backgrounds (geology, engineering, and geography) on the subject of river meandering. The core group of participants attended three workshops which included tours of rivers and research facilities in the United States and Japan. The fourteen papers compiled in the monograph deal with the following subjects: boundary shear stress and sediment transport in river meanders of sand and gravel; sedimentary controls on channel migration and origin of points bars in sand-bedded meandering rivers; flow in meandering channels with natural topography; sediment transport and sorting at bends; sediment control by submerged vanes; analysis of 2-dimensional bed topography model for rivers; linear theory of river meanders; studies on qualitative and quantitative prediction of meander channel shift, finite amplitude development of alternate bars; alternate bars and meandering (free, forced and mixed interactions); evolution and stability of erodible channel beds; observations on several recent theories of resonance and overdeepening in meandering channels; bar and channel formation in braided streams; and topographic response of a bar to variation in discharge. BOUNDARY SHEAR STRESS AND SEDIMENT TRANSPORT IN RIVER MEANDERS OF SAND AND GRAVEL.
California Univ., Berkeley. Dept. of Geology and Geophysics.
W. E. Dietrich, and P. Whiting.
IN: River Meandering. Water Resources Monograph 12. American Geophysical Union, Washington. 1989. p 1-50, 29 fig, 1 tab, 45 ref. NSF Grants ENG78-16977 and CEE-8307142. American Chemical Society Grant ACS-PRF-18427-AC2.

Descriptors: *Channel morphology, *Geomorphology, *Meanders, *River flow, *Sediment transport, *Shear stress, Bed load, Channel flow, Channel scour, Gravel, Mathematical studies, Particle size, Sand, Topography.

Field measurements in a sand-bedded river and in two gravel-bedded ones were compared to examine controls on boundary shear stress fields, sediment transport processes, and sorting in meanders. Analysis of detailed flow field measurements in the sand-bedded river meander and over a gravel-bedded alternate bar reveals a well-defined spatial structure to the magnitude and sign of forces controlling boundary shear stress that arise from topographically-induced spatial accelerations. The relationship between bedload transport and boundary shear stress fields in river meanders varies with size and heterogeneity of bed material. In bends of moderately to well sorted sand in flows generating boundary shear stresses well above critical (such as in large sandy rivers), downstream varying boundary shear stress is matched by topographically-induced cross-stream transport of sediment. In meanders with high excess shear stress but poorly sorted coarse sand and fine gravel, boundary shear stress variation downstream is partially matched by surface grain size adjustments and by net cross-stream sediment flux. Maxima of bedload transport rate and boundary shear stress do not correspond in some areas. In gravel-bedded meanders with low excess boundary shear stress and low sediment supply, bedload may be much finer than the bed surface, and significant areas of bar surface are covered with grain sizes that constitute a very small portion of the bedload. Substantial bedload transport may only occur over a narrow portion of the bed width where boundary shear stress relative to critical stress of the surface is highest and where the sediment flux from upstream is locally concentrated. In this case, grain size adjustments dominate over topographically-induced cross-stream sediment transport in controlling the relationship between boundary shear stress and bedload transport fields. SEDIMENTARY CONTROLS ON CHANNEL MIGRATION AND ORIGIN OF POINT BARS IN SAND-BEDDED MEANDERING RIVERS.
Tsukuba Univ. (Japan). Environmental Research Center.
H. Ikeda.
IN: River Meandering. Water Resources Monograph 12. American Geophysical Union, Washington. 1989. p 51-68, 18 fig, 44 ref.

Descriptors: *Alluvial plains, *Channel morphology, *Geomorphology, *Meanders, *Sediment transport, Channel flow, Gravel, River beds, Sand.

Field observations in alluvial meandering rivers have revealed that plan form and migration pattern of channels are strongly influenced by the distribution of thick fine-grained cohesive deposits in flood plains. Meandering channels can be classified into four types according to the influence of these cohesive deposits: (1) fixed meanders, (2) restricted meanders, (3) confined free meanders, and (4) truly free meanders. Laboratory experiments and field observations of point bars in low gradient sand-bedded meandering rivers have revealed that, unlike in gravel-bedded rivers, point bars develop in response to the pattern of flow through the beds, that is point bars in these rivers are a result rather than a cause of meandering. Point bar platforms, which are the flat tops of point bars, are gradually covered in these rivers by inner bank accretions deposited out of suspension. Therefore, bends with well developed point bar platforms lacking accretion deposits must be in a state of active channel migration and, consequently widening. (See also W91-03203) (Author's abstract)

FLOW IN MEANDERING CHANNELS WITH NATURAL TOPOGRAPHY.
Washington Univ., Seattle. Geophysics Program.
J. M. Nelson, and J. D. Smith.
IN: River Meandering. Water Resources Monograph 12. American Geophysical Union, Washington. 1989. p 69-102, 13 fig, 24 ref.

Descriptors: *Channel flow, *Channel morphology, *Geomorphology, *Meanders, *Model studies, *Topography, Flow velocity, Sediment transport, Shear stress.

A predictive model for velocity, surface elevation, and boundary shear stress fields in natural meander bends is presented. The approach retains streamwise convective accelerations in the lowest order momentum equations and can be used to investigate flow in channel bends with curvature and topography that vary significantly in the streamwise direction, as is the case in most natural streams and rivers. The total boundary shear stress field obtained from computations includes both skin friction and the form drag associated with pressure forces on bars and bedforms. A simple method for removing the form drag component permits computation of the bottom stress responsible for sediment transport. Results of calculations are compared to measurements obtained in Muddy Creek, a sand-bedded meandering stream in Wyoming possessing the characteristics typical of natural channels. Model predictions of velocity, boundary shear stress, and surface elevation were in excellent agreement with the measurements, primarily due to the careful treatment of convective accelerations in the governing equations. ANALYSIS OF A 2-D BED TOPOGRAPHY MODEL FOR RIVERS.
Waterloopkundig Lab. te Delft (Netherlands).
N. Struiksma, and A. Crosato.
IN: River Meandering. Water Resources Monograph 12. American Geophysical Union, Washington. 1989. p 153-180, 12 fig, 6 tab, 32 ref.

Descriptors: *Channel morphology, *Geomorphology, *Mathematical models, *Meanders, *Model studies, *River beds, *Sediment transport, *Topography, Comparison studies, Flow velocity, Steady flow, Unsteady flow.

Processes of river bed deformation were studied by analysis of a time-dependent 2-dimensional model for river bed topography. The occurrence and behavior of propagating alternate bars are described with a non-steady state analysis. Due to the relatively large propagation velocity of these bars, this type of bed perturbation cannot give an explanation of the much more steady meandering process, which is characterized by the point bar-pool configuration. A steady state analysis turns out to be more appropriate to describe the meandering process. In terms of wave length and longitudinal damping rate, this analysis provides a good description of the phenomena involved. For conditions prevailing in meandering rivers it appears that the result of the interaction between water and sediment motion depends on the ratio of two characteristic adaptation lengths which govern the two independent equations for the flow and for the bed deformation, respectively. In addition, it is shown that the degree of non-linearity of the sediment transport with flow velocity is also an important parameter. The results of the analysis are compared with data from a straight flume experiment with movable bed, in which at the inflow a steady perturbation was imposed, and with data from a curved flume experiment with movable bed and fixed banks. The predicted equilibrium bed topographies in the two experiments agree well with the measured ones. In the straight flume experiment the complete and the simple versions of the linear model give rather similar results (the simple model in this case gives a better prediction). The unsteady linear solution of the complete model gives a rather good prediction of alternate bar wave lengths. The influence of curvature and of secondary flow inertia are shown to play an important role in the phenomenon. In this case the complete model cannot be further simplified. Studies on alluvial meandering rivers in Japan show that alternative bars appear to be a universal feature of these rivers, two meander patterns are found in the river, and in sinuous meanders, the whole bend migrates downstream at a uniform rate. Meander patterns are classified as simple symmetrical, simple asymmetrical, compound symmetrical, compound asymmetrical, and lobing or double heading. Migration rates of natural river channels have been measured by regression relations between a meander loop and the upstream drainage area, and by dendrochronology. A mechanistic analysis for meander channel changes is based on a theory that assumes the bank erosion rate at any point is in proportion to the near-bank perturbation of depth-averaged flow velocity. Studies of the interrelationships among factors governing channel changes in alluvial rivers show that the influence of channel planform on bank shift is indirect. The planform gives rise to bank erosion or accretion by means of the associated variation in bed topography. However, channel planform does play an important local role in the formation of planimetric flow separation along the inside bank. When this occurs it can yield strong deposition of suspended sediment. This phenomenon can be viewed as a direct effect of channel planform on bank shift. Studies using the universal erosion coefficient in equations governing bank erosion show that the general bank erosion coefficient and the general coefficient for the real erosion rate during a flood maintain values of a similar order of magnitude among a variety of rivers. These parameters thus provide a universal means for characterizing the coefficient necessary to predict bank erosion rates. (See also W91-03203) (Geiger-PTT)

FINITE AMPLITUDE DEVELOPMENT OF ALTERNATE BARS.
Public Works Research Inst., Tsukuba (Japan). River Hydraulics Div.
S. Fukuoka.
IN: River Meandering. Water Resources Monograph 12. American Geophysical Union, Washington. 1989. p 237-265, 21 fig, 23 ref.

Descriptors: *Channel flow, *Channel morphology, *Geomorphology, *Mathematical models, *Meanders, Bank erosion, Reviews, River beds, Sediment discharge.

The planform of the channel associated with the concentration of flow along the river bank is the meander; the corresponding bedform is the alternate bar. To carry out safe and proper flood control measures, it is necessary to determine the equilibrium shapes of alternate bars and meanders, as well as the flow in channels with such morphological features. The flow in a channel with arbitrary periodic planform and alternate bar pattern can be determined with considerable accuracy by using plane two-dimensional analysis. Flow over alternate bars has been studied taking into account the nonlinearity of the flow. The nonlinearity of flow plays an important part in stabilizing the wave height of alternate bars. Since the analysis becomes complicated when the nonlinearity of flow is considered, a straight channel is assumed for the planform to simplify the representation of the shape of alternate bars. The hydraulic indicators for bank erosion to be used in a straight channel with alternate bars and erodible banks were investigated. The transverse slope of the bed, streamline deviation, water level and flow velocity are appropriate hydraulic indicators of a point of flow attack. Temporally varying bars were investigated by photographing and analyzing the movement of bed material with a video camera. The process of development leading to the equilibrium of alternate bars was explained from the relationship between the flow velocity vector and the sediment discharge distribution. The spatial distribution of longitudinal and transverse bed load transport rates and the process of sediment transport and the path difference according to grain size were measured in a bend of a small meandering river with an equilibrium bed profile. An equilibrium bed profile appears when a net outward sediment discharge occurs in a region with maximal bed shear stress. Dimensional analysis is often used to predict equilibrium wave height and length. The equilibrium wave height of alternate bars was studied in the context of changes in sediment discharge. A systematic treatment is given of the linear and weakly nonlinear aspects of the development of flow and bottom perturbations of lengthscale of the order of channel width in developing meanders. Mathematical models show that an originally straight channel with cohesionless boundary and uniform grain size, unless the channel is too narrow or too wide, undergoes an instability process which, on a relatively fast time scale, leads to the formation of migrating perturbations (alternate bars). As channel widening proceeds, provided the width ratio exceeds a second threshold value above which spatial disturbances may grow, the channel undergoes a second instability process, a planimetric one. The latter process, the details of which still require to be elucidated, is not primarily determined but is definitely affected by the presence of free bars. As the amplitude of meander increases, so does sinuosity, so that free bars tend to decrease their amplitude till they disappear, leaving only forced bars to induce bank erosion. The above model needs further refinements to be able to describe features of the process which have so far been neglected, namely transport in suspension, grain sorting, entrance and wall effects, and unsteadiness. The effect of resonance is the same in all the mathematical models presented. Further experimental and field verification of the whole picture is also needed through carefully designed experiments. EVOLUTION AND STABILITY OF ERODIBLE CHANNEL BEDS.
Washington Univ., Seattle. Geophysics Program.
J. M. Nelson, and J. D. Smith.
IN: River Meandering. Water Resources Monograph 12. American Geophysical Union, Washington. 1989. p 321-377, 37 ref.

Descriptors: *Channel erosion, *Channel morphology, *Geomorphology, *Mathematical models, *Meanders, *Model studies, *Sediment erosion, Algorithms, Channel stability, Sediment transport, Shear stress, Topography.

A computational model for flow and boundary shear stress fields in natural channels is combined with a bedload transport algorithm to investigate the genesis and finite amplitude characteristics of riverine bars. Since the time scales associated with bar growth and migration are typically much larger than the time scales of the flow, the flow is treated in a quasi-steady manner, and the modification of the bed topography due to convergences and divergences in the sediment flux field is coupled to the flow model using a simple iterative technique. The topographic evolution algorithm yields accurate predictions of the development of point bars in curved channels and indicates that, while the origin of point bars is primarily due to curvature-induced secondary flow, the ultimate stability of these features is related to topographically-induced streamwise convective accelerations, as well as to gravitational modification of sediment fluxes by bar slopes. The technique presented is also used to investigate the mechanics of alternate bars in straight channels. Comparison of the nonlinear theory with a simple linear stability analysis for these features is used to demonstrate the importance of the nonlinear effects, and to provide a clearer physical understanding of the alternate bar instability. In contrast to point bars, the initial instability of alternate bars is shown to depend on a simple topographic steering response, while the finite amplitude characteristics of these features depend on gravitational effects and the production of secondary flow associated with the curvature of flow streamlines. The evolution model yields good predictions of the finite amplitude morphology of both point and alternate bars, as demonstrated by comparison of model predictions and measured bathymetry for several experimental studies. Three recent linear treatments of alternate bars and flow in meandering channels are compared in terms of a unified framework that is used to clarify the relation between such self-excited topographic effects as alternate bars and curvature-driven phenomena such as point bars. The equation of depth-averaged transverse momentum balance, which may be driven by topography or curvature, is decoupled from the equation governing secondary flow, which is driven essentially by curvature alone. All three theories are found to yield similar results for the phenomena of resonance and overdeepening. For typical natural channels, the equation of transverse momentum balance can be decomposed into a relation governing depth-averaged transverse velocity, and a relation governing helical secondary flow. The two are not directly coupled to each other. Helical secondary flow may be taken to be purely curvature-driven, and unaffected by bed topography at the linear level, whereas the depth-averaged component may be strongly affected by bed topography. Secondary flow may be neglected in a linear treatment of alternate bars. Alternate bar instability can be predicted even in a theory that neglects the linear inertial and frictional terms associated with depth-averaged transverse velocity. The approximate theory provides critical values of ratio of half-width to base flow depth for the inception of alternate bars that are in essential agreement with the more previous theories. The same approximation, i.e. neglect of ratio half-width to base flow depth terms associated with depth-averaged transverse velocity, yields a linear treatment of bend flow that is much simpler from that of (See also W91-03203) (Author's abstract)

BAR AND CHANNEL FORMATION IN BRAIDED STREAMS.
Kyoto Univ. (Japan). Disaster Prevention Research Inst.
Y. Fujita.
IN: River Meandering. Water Resources Monograph 12. American Geophysical Union, Washington. 1989. p 417-462, 30 fig, 3 tab, 75 ref.

Descriptors: *Braided streams, *Channel flow, *Channel morphology, *Geomorphology, *Meanders, *Sediment transport, Hydraulic properties, Theoretical analysis.

Detailed hydraulic experiments were carried out on the behavior of multiple row bars and the formation of braided streams in three flumes, with widths of 0.5, 1.8, and 3.0 m. The characteristic features of change in bed configuration, and also stream bed variation, were described. Higher modes of bars were observed to evolve into lower ones. Braided patterns appeared in cases with small depths; during this transition to lower modes, bar geometry changed suddenly, increasing in wavelength and heights. Bars in high modes proved to have the same hydraulic properties as alternate bars. Several results of previous studies on alternate bars could be applied to predict the behavior of multiple-model bars. It was concluded that the formation of bars of various modes, and stream braiding, as well, can be predicted by a criterion that allows the co-existence of several modes, and corresponds to results of an existing linear stability theory. The times required for the development and the reduction of bar mode are analyzed using the bar heights of individual modes in equilibrium. Mechanisms controlling the formation of the lowest mode and the development of braided streams should be examined more quantitatively from the viewpoint of sediment transport. RESTORATION OF DEGRADED RIVERINE/RIPARIAN HABITAT IN THE GREAT BASIN AND SNAKE RIVER REGIONS.
White Horse Associates, Smithfield, UT.
S. E. Jensen, and W. S. Platts.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Covelo, California. 1990. p 367-404, 14 fig, 94 ref, 2 append.

Descriptors: *Habitat restoration, *Riparian land, *Stream restoration, *Water resources management, *Wetland restoration, *Wetlands, Environmental impact, Planting management, Riparian waters, Soil-water-plant relationships, Water resources development, Watershed management, Wildlife habitats.

Riverine/riparian habitat (RRH) includes interdependent aquatic (riverine) and streamside (riparian) resources that are valuable for fish and wildlife habitat, flood storage and desynchronization, nutrient cycling and water quality, recreation, and heritage values. RRH includes resources both wetter and drier than stipulated for wetlands. Whereas the 'natural or achievable state' of a riparian habitat may be wetland, the 'existing state' may be non-wetland because of natural or anthropogenically-induced changes in the hydrologic character of RRH. There are many different types of RRH, each with distinctive structure, function, and values. Restoration commonly requires: planning to identify preliminary goals and a general approach; baseline assessments and inventories; designs from which the feasibility of accomplishing goals can be assessed; evaluation to assure compliance with designs; and monitoring of variables important to goals and objectives. The goals, approach, and design of restoration projects must be tailored to each type of RRH. Some general elements important to restoration of degraded RRH are: establishment of hydrologic conditions compatible with project goals; efficient handling of soil and substrates in construction; selection and propagation of plants suited to the site and project goals; evaluation of features to enhance habitat for target species; maintenance and control of impacts; and scheduling construction to reflect site constraints and goals. Comptes Rendus de l'Academie des Sciences (Serie 3) Sciences de la Vie CRAMED, Vol. 311, No. 6, p 219-224, September 13, 1990. 3 fig, 1 tab, 10 ref. English summary.

Descriptors: *Chlorophyll, *Estuarine environment, *Phytoplankton, *Plumes, *Primary productivity, *Rhone River, Biomass, Carbon, Estuaries, Stratification.

The distribution of chlorophyll biomass and productivity in the Rhone River plume was studied in three size-fractionated phytoplankton assemblages: microplankton (>10 microns), nanoplankton (10-3 microns) and picoplankton (<3 microns) in relation to hydrological structures. Measurements were made at different stations inside and outside the Rhone plume in May 1988. Seawater samples from 4 light levels were fractionated by passing through a cascade of three different membranes for chlorophyll and carbon fixation measurements (4 hr in situ simulated incubation). Inside the plume, chlorophyll biomass of entire populations showed typical profiles of stratified waters with a chlorophyll maximum in a range from 5 to 8 micrograms/L located at the maximum density gradient. Outside the discharge, surface water layers were more homogenous and chlorophyll values did not exceed 3 micrograms/L. Water layer density influenced the distribution and the biological activity of phytoplankton size fractions. In the upper layer characterized by low salinity, half the chlorophyll biomass was due to nanoplankton. Nanoplankton and picoplankton fixed inorganic carbon to a similar extent (40%). In underlying typical marine waters, 60% of phytoplankton biomass and productivity were achieved by picoplankton. Transitional waters were characterized by an abundant microplankton constituting more than 50% of total chlorophyll biomass whose carbon fixation was higher at the pycnocline and, particularly, near the plume front. FLOW DISTRIBUTION IN THE ST. LAWRENCE RIVER SYSTEM AT WOLFE ISLAND, KINGSTON BASIN, LAKE ONTARIO.
McMaster Univ., Hamilton (Ontario). Dept. of Civil Engineering and Engineering Mechanics.
I. K. Tsanis, and C. R. Murthy.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 3, p 352-365, 1990. 8 fig, 5 tab, 11 ref.

Descriptors: *Flow discharge, *Lake Ontario, *Limnology, *St Lawrence River, Flow measurement, Flow rates, Flowmeters, Hydrologic data collections, Satellite technology.

Determination of the mass output through the St. Lawrence River outflow system is an important component in computing a mass balance of chemical loadings in Lake Ontario. Toward this goal, a network of self recording current meter moorings were deployed in the main channels of the St. Lawrence River system in Lake Ontario during 1986 and 1987. On two occasions in 1987, detailed Lagrangian experiments were carried out using a cluster of satellite drifters. The time series data from the current meter network and Lagrangian drifter experiments provided the horizontal and vertical distribution of currents that are adequate to compute the distribution of water transport through the St. Lawrence outflow. The flow distribution in the St. Lawrence River at Wolfe Island is approximately 55% in the south channel and 45% in the north channel. The total flow rate through the St. Lawrence River system from the present study is in good agreement with the direct measurements at the powerplant control facilities at Cornwall. COMPARISON OF MEASURED AND SIMULATED FLOWS DURING THE 15 DECEMBER 1987 DETROIT RIVER FLOW REVERSAL.
National Oceanic and Atmospheric Administration, Ann Arbor, MI. Great Lakes Environmental Research Lab.
J. A. Derecki, and F. H. Quinn.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 3, p 426-435, 1990. 10 fig, 6 ref.

Descriptors: *Detroit River, *Flow models, *Flow profiles, *Great Lakes, *Model studies, *Path of pollutants, *River flow, *Wind-driven currents, Flow measurement, Flow velocity, Mathematical models, Simulation analysis, Water level fluctuations.

Flow reversals in the Detroit River were directly measured by an acoustic Doppler current profiler deployed on the river bottom at Ft. Wayne for about 8 hr on 15 December 1987. The meter provided continuous measurements of the vertical velocity distribution for approximately 1-m depth segments in the overhead water column at quarter-hour intervals. These measurements provided an ideal data set to analyze river dynamics associated with flow reversals and to evaluate the importance of major factors necessary for the occurrence of flow reversals in the river. Analysis of the measurements showed that reasonably accurate simulation of flow reversals with the unsteady flow models require the inclusion of surface wind shear and the use of small time increments that are much shorter than the standard hourly water level data. Model simulation with specially obtained 5 and 15 minute water level and wind data produced generally similar model flows that are reasonably close to the measured values. Because short-period (15 minute or less) wind and water level data are not readily available, river flow reversals simulated using hourly data may be significantly underestimated. (Author's abstract)

USE OF PARAMETER TRANSFORMATIONS IN NONLINEAR, DISCRETE FLOOD EVENT MODELS.
Commonwealth Scientific and Industrial Research Organization, Wembley (Australia). Div. of Water Resources.
B. C. Bates.
Journal of Hydrology JHYDA7, Vol. 117, No. 1/4, p 55-79, September 1990. 8 fig, 5 tab, 29 ref.

Descriptors: *Flood forecasting, *Hydrologic models, *Model studies, *Parameterization, *Rainfall-runoff relationships, Algorithms, Australia, Nonlinear flood event models, Parameter transformations, Statistical analysis.

The use of parameter transformations in calibration and post-calibration studies of conceptual rainfall-runoff models is often justified on the basis of their ability to speed the convergence of automatic parameter estimation algorithms, improve the sampling properties of the parameter estimates, and improve statistical inferences that are based on conventional linear model theory. An examination of the abilities of parameter transformations was undertaken using a nonlinear flood event model, rainfall-runoff data from six Australian catchments, a Gauss-Newton optimization algorithm, three measures of statistical nonlinearity, and three types of joint confidence regions (exact, likelihood, and linear theory) for the model parameters. Results indicated that the 'expected value' transformation of Ross and the power transformation of Tsai can lead to improved sampling properties and statistical inferences on model parameters. However, it is clear that the effect of model reparameterization on the convergence of optimization algorithms may only be slight, and that care must be taken when applying parameter transformations to nonlinear flood event models. Descriptors: *Geomorphology, *Hydrograph analysis, *Model studies, *Parameter estimation, *Runoff forecasting, *Unit hydrographs, Geomorphologic unit hydrograph, Hydrography, Multireservoir networks, Numerical analysis, Regression analysis, Shape parameters, Watersheds.

Numerical experiments were carried out to explore: (1) the relationship between the dimensionless third moment and the dimensionless second moment of the classical geomorphologic unit hydrograph (GUH); (2) the sensitivity of this shape indicator to the assumption in the GUH model relating the time delay in a stream segment to some power of the segment length; (3) the relationship between the parameters of the GUH and the geomorphic parameters of the catchment. A closed form analytical solution specifying completely the GUH can be derived using only the formula for the most probable distribution of tributaries of given order among channels of higher order and the classical deterministic analysis based on routing through unequal linear reservoirs. Consequently, the parameters of the GUH can be expressed in terms of geomorphic parameters and a single scaling factor such as the delay time for the reservoir at the outlet from each first order basin or the lag of the catchment response. The dimensionless parameters of the GUH are in most cases highly determined by linear regression in logarithmic space on the geomorphic parameters, and the individual GUH parameters are sensitive to the assumption about the relative sizes of the reservoirs at the outlet of different orders but the product of the peak and the lag of GUH is remarkably stable. The shape of the GUH is closely approximated by the Nash model of a cascade of equal linear reservoirs for all three assumptions about storage variations. (MacKeen-PTT)

Journal of Hydrology JHYDA7, Vol. 117, No. 1/4, p 133-151, September 1990. 9 figs, 5 tab, 20 ref.

Descriptors: *Hydrologic models, *Infiltration, *Model studies, *Ponds, *Seepage, *Storm runoff, *Storm water management, *Surface-groundwater relations, Hydrology, North Carolina-Barrier islands, Numerical analysis, Pond seepage, Saturated flow, Saturation zone, Seepage rates, Soil properties, Three-dimensional model, Unsaturated flow.

The State of North Carolina requires plans for stormwater, sediment, and erosion management for much of the commercial construction along the coast. Such plans may employ infiltration ponds for stormwater runoff control. Although the concept is fairly straightforward, the factors controlling the operation of these ponds are not well understood. A numerical solution to the Richards equation for three-dimensional (3-D), combined unsaturated and saturated flow was used to analyze pond seepage for geometries characteristic of the North Carolina Barrier Islands. Two-dimensional and three-dimensional seepage rates were obtained for 10 x 10 x 1 m deep ponds, located 16-195 m from the sinks, and spaced 10-190 m apart for two profile depths, 3 and 9 m. For the geometries and soil properties considered, pond seepage was dominated by flow in the saturated zone. The spacing between adjacent ponds affected seepage rates, having a greater effect for large island widths. The numerical solutions were used to develop and test an approximate analytic solution for 3-D steady pond seepage. The approximate solution was obtained by dividing the flow regime into radial and linear flow domains. The predicted rates of the analytic solution agreed with those obtained from the numerical solution. (MacKeen-PTT)

HYDRAULICS OF INTERRILL OVERLAND FLOW ON A SEMI-ARID HILLSLOPE, SOUTHERN ARIZONA.
Keele Univ. (England). Dept. of Geography.
A. J. Parsons, A. D. Abrahams, and S.-H. Luk.
Journal of Hydrology JHYDA7, Vol. 117, No. 1/4, p 255-273, September 1990. 12 fig, 2 tab, 21 ref. NATO Grant RG.85/0066.

Descriptors: *Erosion, *Hydraulic properties, *Overland flow, *Rainfall-runoff relationships, *Runoff plot, *Semiarid lands, *Soil erosion, Arizona, Flow resistance, Reynolds number, Simulated rainfall, Slopes.

Simulated rainfall experiments were conducted on an 18 by 35 m runoff plot located in southern Arizona. By using a wide plot that extended from the divide to beyond the rill heads, it was possible to examine the full range of lateral variability and downslope changes in interrill overland flow on a shrub-covered, semi-arid piedmont hillslope. The mean depth (d), mean velocity (v), and Reynolds number (Re) of overland flow were computed for two measured sections situated 12.5 and 21 m from the top of the plot. At-a-section d vs. Re and v vs. Re relations showed that increases in Re are accommodated largely by increases in d. These hydraulic relations are principally the result of resistance to flow increasing with Re as overland flow spreads into new areas. Inasmuch as the maximum (equilibrium) discharge simulated in these experiments has a return period of about 7 yr, increasing resistance to flow as Re increases may be considered typical of most overland flow events on shrub-covered, piedmont hillslopes in southern Arizona. Downslope hydraulic relations differ strikingly from at-a-section relations. Under equilibrium runoff conditions, resistance to flow decreases rapidly as Re increases, permitting increases in Re to be accommodated entirely by increases in v. The decrease in resistance to flow is due to progressive downslope concentration of flow into fewer, deeper threads. Under non-equilibrium conditions, downslope hydraulic relations may be quite different from those obtained at equilibrium, but resistance to flow always decreases downslope. This is a result of low flows following pathways formed by higher flows that concentrate downslope. Analyses of overland flow hydraulics at the scale of interrill areas produce results that are quite different from those obtained from small plots. A knowledge of the hydraulics at this scale is essential if models of interrill overland flow are to become more realistic and, hence better predictors of runoff hydrographs and sediment yield. COMPUTATION OF THE INSTANTANEOUS UNIT HYDROGRAPH AND IDENTIFIABLE COMPONENT FLOWS WITH APPLICATION TO TWO SMALL UPLAND CATCHMENTS.
Australian National Univ., Canberra. Centre for Resource and Environmental Studies.
A. J. Jakeman, I. G. Littlewood, and P. G. Whitehead.
Journal of Hydrology JHYDA7, Vol. 117, No. 1/4, p 275-300, September 1990. 10 fig, 6 tab, 43 ref, append.

Descriptors: *Hydrographs, *Hydrological models, *Instantaneous unit hydrographs, *Model studies, *Rainfall-runoff relationships, *Streamflow, *Streamflow forecasting, *Unit hydrographs, Climatic data, Excess rainfall, Precipitation, Rainfall, Small watersheds, Wales, Watersheds.

A model for relating data on rainfall and other climatic variables to streamflow was presented. The approach is based upon three factors: (1) the representation of total streamflow response as a linear convolution of the instantaneous unit hydrograph with rainfall excess; (2) approximation of this representation in discrete time by a rational transfer function relationship which involves an efficient and flexible parameterization; and (3) use of a simple refined version of the instrumental variable method of parameter estimation as the major tool to determine the number of identifiable flow components in the representation and to estimate their dynamic contributions to the instantaneous unit hydrograph. Stream hydrograph separation is undertaken by convoluting rainfall excess with the identified components of the unit hydrograph. The procedure was applied to two small catchments in Wales. The results demonstrate that at sampling intervals of the order of one hour, successful separation of quick and slow flow components can be achieved with short time series of rainfall and streamflow. The U.S. Geological Survey (USGS) has been active in West Virginia since the early 1900's. During recent years, the District completed several investigations as well as initiated others. An intense effort has been made to publish interpretive reports and data on a near-current basis. As a result of this effort, a significant number of water resources reports were completed and/or published during the 1989 fiscal year. This report contains a complete list of USGS reports addressing West Virginia hydrology as of December 1989. The mission of the Water Resources Division is to provide the hydrologic information and understanding needed for the optimum utilization and management of the Nation's water resources for the overall benefit of the people in the United States. This is accomplished, in large part, through cooperation with other Federal and non-Federal agencies, by: (1) Collecting, on a systematic basis, data needed for the continuing determination and evaluation of the quantity, quality, and use of the Nation's water resources; (2) Conducting analytical and interpretive water resource appraisals describing the occurrence, availability, and the physical, chemical, and biological characteristics of surface and groundwater; (3) conducting supportive basic and problem-oriented research in hydraulics, hydrology, and related fields of science to improve the scientific basis for investigations and measurement techniques and to understand hydrologic systems sufficiently well to quantitatively predict their response to stress, either natural or manmade; (4) disseminating the water data and the results of these investigations and research through reports, maps, computerized information services, and other forms of public releases; (5) Coordinating the activities of Federal agencies in the acquisition of water data for streams, lakes, reservoirs, estuaries, and groundwaters; and (6) Providing scientific and technical assistance in hydrologic fields to other Federal, State and local agencies, to licensees of the Federal Power Commission, and to international agencies on behalf of the Department of State. Journal of Hydrology JHYDA7, Vol. 118, No. 1/4, p 387-403, October 1990. 10 fig, 37 ref.

Descriptors: *Hydrographs, *Rainfall-runoff relationships, *Simulation analysis, *Surface runoff, *Watersheds, Base flow, Infiltration, Pennsylvania, Rainfall area, Saturation zone, Stream discharge.

The initial contributing area (ICA) of a watershed at the onset of rain is defined as consisting of the stream surface and the area of surface saturation caused by the groundwater table intersecting the land surface above the elevation of the stream. Subsurface flow discharges upward within this area, so the ICA exhibits zero infiltration capacity and potential storage for rainfall. Thus, the ICA is the initial runoff-producing area in variable-source-area generation of storm runoff. The ICA of a 42-ha east-central Pennsylvania watershed was shown to be a function of prestorm base flow; a prediction equation was developed using rainfall-runoff data from small rainstorms. This equation could be incorporated directly into a continuous streamflow model where a base flow value is part of the simulation, or into an event-based hydrograph model where prestorm baseflow is specified as a design parameter. Descriptors: *Hydrologic models, *Mathematical models, *Model studies, *Mountains, *River flow, *Runoff forecasting, *Streamflow forecasting, *Surface runoff, Glacial streams, Hydrologic budget, Mathematical analysis, Mountain streams, Soviet Union.

The insufficient accuracy of traditional statistical methods has led to the development of a method for the long-term forecasting of runoff in the Central Asian mountainous rivers for the vegetation period, based on a mathematical model. The model describes the whole cycle of runoff formation in mountainous river basins reflecting processes and factors such as precipitation within the various mountain zones, snow cover formation and levels, glaciation, evaporation, and water storage and transport. Testing of the method for the rivers of the Fergana Valley and western Tien Shan has shown that the new model exhibits greater accuracy than the operational statistical forecast method. This is especially true concerning corrections to the forecast in April-May, when the accuracy of estimates of temporary basin storage becomes most important. In addition, numerical experiments revealed that ignorance of glaciation which makes up 3-5% of the total area of mountainous basins leads to considerable errors of summer runoff forecasts. That is why a component for glacial runoff computation was introduced into the model. Consideration of glacial alimentation has eventually improved the estimation of model computation, and forecasts of mountainous river runoff. (Hoskin-PTT)

In many countries the data available in mountainous watersheds are rare and sometimes the required data are accessible only in monthly time steps or as average daily values over a given month. This study emphasizes the search for an appropriate structure of a monthly water balance model, in conjunction with a nonlinear parameter estimation algorithm, capable of simulating the monthly streamflow in seasonally snow-covered mountainous watersheds, and requiring a minimum number of parameters and amount of input data. Several model structures based on a soil water balance concept were compared for the Rudak catchment of Iran. The main distinction between the different structures was made by the inclusion of either a linear or a nonlinear transformation element for the conversion of overland flow or baseflow into total runoff. A combined water balance model having two main elements, a soil storage element generating excess water, and a transformation element conceptualized by a linear storage-discharge relationship (a linear lumped conceptual model), was found to be the most accurate.

The integration of a nonlinear storage-discharge relationship which leads to a second order nonlinear model did not prove to be more successful than a linear or nonlinear first order element. (Hoskin-PTT)

W. P. James, and K. W. Kim.
Water Resources Bulletin WARBAQ, Vol. 26, No. 4, p 587-596, August 1990. 9 fig, 3 tab, 20 ref.

Descriptors: *Hydrologic models, *Mathematical models, *Model studies, *Overland flow, *Rainfall-runoff relationships, *Runoff forecasting, *Simulation analysis, *Watershed models, Data interpretation, Drainage patterns, Mathematical analysis, Mathematical equations, Surface drainage.

A distributed watershed model was developed to mathematically simulate overland and channel flow for a single-event storm. The modeled watersheds in the study were subdivided into rectangular grid elements. All hydrologically significant parameters, such as land slope, rainfall and precipitation excess, were assumed to be uniform within each element. The Green-Ampt method was adopted to generate precipitation excess for each element during the simulation period. A two-dimensional diffusion wave model was used for overland flow routing and an iterative Alternative Direction Implicit scheme was used to solve the simultaneous overland flow equations. Once the overland flow became inflow to the channel, a one-dimensional dynamic wave flood routing technique, based on a four-point, implicit, non-linear finite difference solution of the St. Venant equation of unsteady flow, was applied. A limited number of comparisons were made between simulated and observed hydrographs for areas of about one square mile. Given the appropriate parameters, the model was able to accurately simulate runoff for single-event storms. Comparisons were made between simulated and observed hydrographs for three watersheds. The model was able to accurately simulate the runoff for single-event storms using 61-m by 61-m (200 ft by 200 ft) watershed grid elements. (Author's abstract)

LINEAR PROGRAMS FOR NONLINEAR HYDROLOGIC ESTIMATION.
California Univ., Santa Barbara. Dept. of Geography.
H. A. Loaiciga, and R. L. Church.
Water Resources Bulletin WARBAQ, Vol. 26, No. 4, p 645-656, August 1990. 5 tab, 18 ref. California Water Resources Center Grant W-752.

Descriptors: *Hydrologic models, *Linear programming, *Mathematical equations, *Mathematical models, *Model studies, *Rainfall-runoff relationships, *Runoff forecasting, Hydrology, Mathematical analysis, Regression analysis, Runoff, Surface runoff.

The process of calibrating a hydrologic model is of great importance in applied hydrologic studies. The minimization of the sum of absolute deviations and the minimization of the absolute maximum deviation (minimax) have been transformed into equivalent linear programs for the estimation of parameters in a transient and linear hydrologic system. These two methods yield viable parameter estimates that are globally optimal and reproduce properly the timing and magnitude of hydrologic events and associated variables such as total runoff, flood peak and peak-flood magnitude. The two linear estimation methods compared favorably with the popular least-squares nonlinear estimation method. The generality of the theoretical developments shows that linear program equivalents are adequate competitors of nonlinear methods of hydrologic estimation and parameter calibration. (Hoskin-PTT)

ADDITIONAL ANALYSIS OF PEAK-VOLUME RELATIONS AND STANDARDIZATION PROCEDURES.
Louisiana State Univ., Baton Rouge. Dept. of Civil Engineering.
M. E. Molfino, and J. F. Cruise.
Water Resources Bulletin WARBAQ, Vol. 26, No. 4, p 687-692, August 1990. 1 fig, 2 tab, 11 ref.

Descriptors: *Flood hydrographs, *Flood peak, *Hydrologic models, *Mathematical equations, *Model studies, *Peak flow, *Rainfall-runoff relationships, *Runoff forecasting, Hydrology, Mathematical analysis, Mathematical models, Regression analysis, Slopes.

Much has been written about the linear relationship in log space between the runoff volume of a hydrograph and the peak discharge. Three versions of this relation (an original and two standardizations) have been presented and recommended by various authors. The standardized equations were compared to the original relationship and the behavior of the coefficient of determination (r2) in each case is discussed. The r2 of the standardized equations is increased or decreased relative to that of the original relation based upon the magnitude of the original slope. A database of 90 watersheds and over 1200 separate flood hydrographs were used to investigate the comparative utility of these equations. (Author's abstract)

PALYNOSTRATIGRAPHY OF THE CENTRAL WEST MURRAY BASIN.
M. K. Macphail, and E. M. Truswell.
BMR Journal of Australian Geology & Geophysics BJAGDT, Vol. 11, No. 2/3, p 301-331, 1990. 11 fig, 1 tab, 75 ref, 2 append.

Descriptors: *Australia, *Geohydrology, *Geologic history, *Murray-Darling River Basin, *Paleohydrology, *Palynology, Aquitards, Boreholes, Geologic control, Groundwater, Marine environment, Paleoclimatology, Pollen, Rainfall, River basins, Stratigraphy, Vegetation.

Palynological analyses have been undertaken on four boreholes in the central west Murray Basin, in southeastern Australia, to provide a biostratigraphic framework for geological factors related to groundwater. Three of the boreholes penetrated the marine sequence of the Geera Clay, which acts as an aquitard confining groundwater flow within the aquifers of the Renmark Group. The oldest sediments encountered in this study were early Cretaceous (non-marine); followed by marine transgressions during the middle Eocene-early Oligocene and Oligocene-early/middle Miocene (Geera Clay deposition). Pollen assemblages from the Murray Basin contain a number of taxa, many of them with affinities to modern tropical plant species or groups which are unknown in other southeastern Australian basins. Many of these are of potential stratigraphic value. Broad scale shifts in vegetation, presumably in response to climatic change, are discernible in the Late Oligocene to earliest Miocene over much of the basin. There is a suggestion that the initiation of this shift, which reflects a change from year-round to seasonal rainfall patterns, was diachronous for west to east, but patterns of change in space and time are complex, so the correlative value of changes in pollen frequencies remains limited. GEOLOGY AND GROUND-WATER RESOURCES OF THE SAN CARLOS INDIAN RESERVATION, GILA, GRAHAM, AND PINAL COUNTIES, ARIZONA.
Geological Survey, Tucson, AZ. Water Resources Div.
J. G. Brown.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4152, 1989. 39p, 5 fig, 2 plates, 4 tab, 32 ref. Project no. AZ112.

Descriptors: *Alluvial aquifers, *Arizona, *Geohydrology, *Groundwater availability, *San Carlos Indian Reservation, Alluvium deposits, Basin-fill deposits, Specific yield, Transmissivity, Volcanic rocks, Water quality.

The San Carlos Indian Reservation includes about 2,900 sq mi in east-central Arizona. Relatively impermeable pre-Tertiary rocks are exposed in about 23% of the reservation and underlie water-bearing Tertiary and quaternary basin fill and Quaternary stream alluvium in much of the southern part of the reservation. About 9,000 members of the San Carlos Apache Tribe live on the reservation and rely on groundwater to meet public supply, irrigation, and other needs. Basin fill is widespread in the valley of the San Carlos and Gila Rivers and consists of fine sand, silt, limestone, clay, and pyroclastic volcanics that may attain a total maximum thickness of more than 3,200 ft in the reservation. Quaternary stream alluvium overlies the basin fill along many streams and washes. Stream alluvium consists of poorly sorted, unconsolidated, gravelly, muddy, sand; and sandy gravel and reaches a maximum thickness of 100 ft along the San Carlos and Gila Rivers. The volume of recoverable water stored in the basin fill to a depth of 1,200 ft is estimated to be about 20 million acre-ft. The volume of recoverable water stored in the stream alluvium on the reservation is estimated to be more than 100,000 acre-ft. The stream alluvium along the San Carlos River supplies most of the water used for drinking. Water throughout much of the reservation is suitable for most uses except for that in the alluvium along the Gila River, which contains large concentrations of dissolved solids. (USGS)

This report is a compilation of hydrologic and geologic data collected for the period April 1986 through March 1988 for the Canal Creek area of Aberdeen Proving Ground, Maryland. Geologic data include lithologic logs for 73 sites and geophysical logs for 71 sites. Hydrologic data consist of hydrographs and synoptic water level measurements. The hydrographs were taken from eight wells that were equipped with continuous water level recorders, and the synoptic water-level measurements were made four times during the study. Well-construction data also are included for 149 observation wells. (USGS)

GEOHYDROLOGY AND NUMERICAL MODEL ANALYSIS OF GROUND-WATER FLOW IN THE PULLMAN-MOSCOW AREA, WASHINGTON AND IDAHO.
Geological Survey, Tacoma, WA. Water Resources Div.
W. E. Lum, J. L. Smoot, and D. R. Ralston.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4103, 1990. 73p, 27 fig, 7 tab, 42 ref.

Descriptors: *Basalts, *Computer models, *Geohydrology, *Groundwater movement, *Loess, *Model studies, Aquifers, Groundwater, Groundwater budget, Groundwater depletion, Groundwater management, Hydraulic conductivity, Recharge, Seepage, Simulation, Storage coefficient, Surface-groundwater relations.

The geohydrology of the Pullman, Washington-Moscow, Idaho area was investigated by mapping geohydrologic units, determining the distribution of hydraulic head in each unit, and determining some of the components of the water budget. This information was used to construct a three-dimensional groundwater-flow model that incorporates three layers--a surficial loess layer, a Wanapum Basalt layer, and a Grande Ronde Basalt layer. The model was used to assess the effects of changes in the rate of withdrawal of groundwater on the water levels in the geohydrologic units and on streamflow in the area. Recharge to the groundwater system was calculated independent of the model. It was determined that current farming practices use soil moisture more effectively than did natural vegetation, and these practices have reduced groundwater recharge by nearly 10%. The three-dimensional model was calibrated using the time-averaged method for the period 1974-85, and was evaluated by simulating historical pumpage rate changes (1890-1985) and comparing calculated with observed water-level changes. Model results indicate that groundwater levels would stop declining if pumpage were stabilized at a constant level. Levels will continue to decline into the foreseeable future, however, as long as groundwater pumpage continues to increase. The source of the additional simulated pumpage is streamflow depletion near pumping locations. (USGS)

HYDROGEOLOGY AND WATER RESOURCES OF THE LOS OSOS VALLEY GROUNDWATER BASIN, SAN LUIS OBISPO COUNTY.
Geological Survey, Sacramento, CA. Water Resources Div.
E. B. Yates, and J. H. Wiese.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 88-4081, May 1990. 76p, 29 fig, 8 tab, 35 ref.

Descriptors: *Geohydrology, *Groundwater, *Groundwater movement, *Los Osos Valley, *Model studies, *Wastewater disposal, *Water pollution control, California, Groundwater management, Hydrogeology, Recharge, Saline water intrusion, San Luis Obispo County, Seawater, Simulation.

The Los Osos Valley groundwater basin on the central California coast extends about 3 miles inland and an unknown distance offshore, where it is hydraulically connected with the Pacific Ocean. Basin fill consists of unconsolidated, complexly layered sediments; individual beds are thin and discontinuous. Groundwater flow was studied using available data, geologic mapping, drilling, and measurements of potentiometric head, water quality, and streamflow. A three-dimensional digital model of the basin was developed and calibrated to match water levels and head-dependent flows during 1970-77 and 1986. Although the model could not simulate perched water tables, other results were adequate and were not sensitive to small errors in input data. Annual recharge comes from rainfall (80%), groundwater inflow (18%), and net recharge from Los Osos Creek (2%). In 1986, principal outflows were net municipal pumpage (34%), net agricultural pumpage (28%), and net outflow across the ocean boundary (28%). Model simulations of water supply and wastewater disposal options indicated that if wastewater is centrally treated and recharged, locally pumped groundwater could meet projected municipal water demand through the year 2010 without causing seawater intrusion, even during brief droughts. If wastewater is exported from the basin, seawater intrusion is likely even if imported water meets approximately half of municipal water demand in the 2010. Wastewater recharge may cause long-term salt buildup in the basin and local waterlogging of soils. (USGS)

MAP OF MEAN ANNUAL RUNOFF FOR THE NORTHEASTERN, SOUTHEASTERN, AND MID-ATLANTIC UNITED STATES, WATER YEARS 1951-80.
Geological Survey, Madison, WI. Water Resources Div.
W. R. Krug, W. A. Gebert, and D. J. Graczyk.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 88-4094, 1990. 11p, 2 fig, 1 pl, 6 tab, 5 ref.

Descriptors: *Data collections, *Hydrologic data, *Maps, *Runoff, *Stream discharge, *Water resources data, Gaging stations.

A map of mean annual runoff for States within the Northeastern, Southeastern, and Mid-Atlantic United States was prepared by the U.S. Geological Survey for the Direct/Delayed Response Project being conducted by the U.S. Environmental Protection Agency. This map shows mean annual runoff during water years 1951-80. Mean annual runoff from the northeastern region during 1951-80 ranged from less than 12 to greater than 40 inches. Runoff from the southeastern region runoff ranged from less than 12 to greater than 55 inches. In the mid-Atlantic region ranged from less than 10 to greater than 40 inches. Error analysis using 93 gaging stations not used for preparing the runoff map showed that the runoff map could be used to predict runoff with an average error of less than 10%. Errors in runoff estimation averaged about 12% if the locations of the gaging stations were used to estimate runoff instead of computing an area-weighted average over the basin. If the locations of the gaging stations were used to estimate runoff, there also was a significant negative bias of the errors that did not occur if the centroid or a weighted average runoff of the drainage basin were used. The runoff map is expected to be more accurate in areas that have a relatively high concentration of gaging stations and little topographic variability, such as part of the Northeast. Based on these criteria, the least reliably mapped areas would be in the Smokey Mountains along the North Carolina-Tennessee border. (USGS)

PLAN OF STUDY FOR THE OHIO-INDIANA CARBONATE-BEDROCK AND GLACIAL-AQUIFER SYSTEM.
Geological Survey, Columbus, OH. Water Resources Div.
E. F. Bugliosi.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 90-151, 1990. 27p, 10 fig, 23 ref.

Descriptors: *Aquifer characteristics, *Aquifers, *Geohydrology, *Glacial aquifers, *Groundwater, *Indiana, *Ohio, Aquifer systems, Carbonate rocks, Water use.

The major aquifers of 35,000 sq mi area in western Ohio and eastern Indiana consist of Silurian and Devonian carbonate bedrock and Quaternary glacial deposits. These bedrock units and glacial deposits have been designated for study as part of the U.S. Geological Survey's Regional Aquifer System Analysis program, a nationwide program to assess the regional hydrology, geology and water quality of the Nation's most important aquifers. The purpose of the study is to define the hydrology, geochemistry, and geologic framework of the aquifer system within the Silurian and Devonian rocks and glacial deposits, with emphasis on describing the groundwater flow patterns and characterizing the water quality. The study, which began in 1988, is expected to be completed in 1993. In 1980, the aquifers in the study area supplied more than 280 million gallons of water/day to industry, agriculture, and a population of more than 6.3 million people. With a projected future population growth to 7.1 million in 1990, and with intensified agricultural and industrial uses, water withdrawals from these bedrock and glacial aquifers are expected to be increased. The most significant groundwater problems in the study area result from the pronounced areal differences in availability and quality of the groundwater. These differences are related to the lateral discontinuity of many of the glacial deposits and to variations in secondary permeability of the bedrock aquifers associated with patterns of fracturing. Planned activities of the study include compilation of available geohydrologic and water quality data, such as groundwater levels, geohydrologic properties of aquifers, chemical analyses, land use and water use data, and ancillary data such as digital satellite images. Additional geohydrologic and water quality data may be collected from existing wells or wells that may be drilled for this study. A computerized, geographic information system will be used as a data base management tool and for spatial analysis and presentation of the data. A digital computer model will be developed to study the regional groundwater flow system and to investigate the effects of development on the aquifer system. (USGS)

SIMULATION OF GROUND-WATER FLOW IN THE MISSISSIPPI RIVER VALLEY ALLUVIAL AQUIFER IN EASTERN ARKANSAS.
Geological Survey, Little Rock, AR. Water Resources Div.
G. L. Mahon, and A. H. Ludwig.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4145, June 1990. 26p, 10 fig, 25 ref.

Descriptors: *Alluvial aquifers, *Arkansas, *Computer models, *Geohydrology, *Groundwater movement, *Mississippi-Missouri River Valley, *Model studies, *Pumpage, Hydraulic properties, Recharge, Rivers, Storage coefficient, Transmissivity.

The U.S Geological Survey has developed and calibrated a digital model of the flow system in the alluvial aquifer as part of a multiagency Eastern Arkansas Region Comprehensive Study being conducted by the U. S. Army Corps of Engineers. Other cooperating agencies include the U.S. Soil

Conservation Service, the Arkansas Soil and Water Conservation Commission, and the University of Arkansas. The study was prompted by the growing concern about significant water level declines in the Mississippi River Valley alluvial aquifer north of the Arkansas River in eastern Arkansas. The declines are a result of large groundwater withdrawals, mainly for irrigation. After calibration, the flow model was used to simulate the effects of projected groundwater pumpage through the year 2050, based on estimates made by the U.S. Soil Conservation Service for pumpage scenarios with and without water conservation measures. Simulations of projected pumpage indicated that by the year 2050 water level declines would reduce the saturated thickness of the aquifer to less than 20 ft in large areas of eastern Arkansas. More than 26% of the active cells in the scenario without conservation had saturated thicknesses of 20 ft or less and mroe than 16% in the scenario with conservation. The principal areas where the saturated thickness is expected to reach these critical levels are in the Grand Prairie region and in two areas on the east and west sides of Crowleys Ridge. (USGS)

EVALUATION OF GROUND-WATER RECHARGE ALONG THE GILA RIVER AS A RESULT OF THE FLOOD OF OCTOBER 1983, IN AND NEAR THE GILA RIVER INDIAN RESERVATION, MARICOPA AND PINAL COUNTIES, ARIZONA.
Geological Survey, Tucson, AZ. Water Resources Div.
A. D. Konieczki, and S. R. Anderson.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4148, 1990. 30p, 6 fig, 7 tab, 2 plates, 23 ref. Project No. AZ090.

Descriptors: *Arizona, *Gila River, *Groundwater resources, *Recharge, *Surface-groundwater relations, Gila River Indian Reservation, Maricopa County, Pinal County.

Flow in the Gila River from the flood of October 1983 infiltrated the stream channel and recharged the groundwater system along the Gila River floodplain from Ashurst-Hayden Dam to the confluence with the Salt River. Changes in groundwater levels from January 1983 to March 1984 confirmed the occurrence of recharge to the groundwater system. The average water level change for 74 wells was +24.2 ft. The water-level rise was greatest in the reach from river mile 15 to river mile 22, where the average water level change for 10 wells was +59.4 ft. The average water level increase for 28 miles from river mile 40 to river mile 71 was +14.2 ft. Estimates of recharge from January 1983 to March 1984 ranged from 440,000 to 640,000 acre-ft. A water budget method and a water level change method were used to estimate the recharge to the aquifer. At least 46% to 66% of the recharge was the result of streamflow infiltration from the Gila River during October 1983 to February 1984. The increase in aquifer storage was one to two times greater than the quantity of groundwater pumped from the Gila River Indian Reservation during the 10 years preceding the flood. (USGS)

STRUCTURE AND APPLICATION OF AN INTERFACE PROGRAM BETWEEN A GEOGRAPHIC-INFORMATION SYSTEM AND A GROUNDWATER FLOW MODEL.
Geological Survey, Tucson, AZ. Water Resources Div.
P. C. Van Metre.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Open-File Report 90-165, 1990. 68p, 2 fig, 4 ref. Project No. AZ104.

Descriptors: *Computer models, *Computer programs, *Geographic information systems, *Groundwater movement, *Model studies, Computers, Geographical information systems.

A computer-program interface between a geographic-information system and a groundwater flow model links two unrelated software systems for use in developing the flow models. The interface program allows the modeler to compile and manage geographic components of a groundwater model within the geographic information system. A significant savings of time and effort is realized in developing, calibrating, and displaying the groundwater flow model. Four major guidelines were followed in developing the interface program: (1) no changes to the groundwater flow model code were to be made; (2) a data structure was to be designed within the geographic information system that follows the same basic data structure as the groundwater flow model; (3) the interface program was to be flexible enough to support all basic data options available within the model; and (4) the interface program was to be as efficient as possible in terms of computer time used and online-storage space needed. Because some programs in the interface are written in control-program language, the interface will run only on a computer with the PRIMOS operating system. (USGS)

GROUND WATER MODELING ANALYSIS FOR A CONTAMINATED WATER-SUPPLY WELL FIELD IN INDIANA.
Weston (Roy F.), Inc., West Chester, PA.
J. Y. Yang.
IN: Water: Laws and Management. American Water Resources Association, Bethesda, Maryland, 1989. p 13A-11--13A-18, 7 ref.

Descriptors: *Groundwater pollution, *Groundwater quality, *Indiana, *Model studies, *Monitoring, *Path of pollutants, *Water supply, Solute transport, Trichloroethylene, Volatile organic compounds, Wells.

Trichloroethylene (TCE) contamination was found in a well field in Indiana which provided more than 1,300 million gallons a year for domestic water supply purposes. The initial discovery of TCE contamination occurred in April 1981, during routine testing of finished water by the EPA. All 15 production wells in the well field have shown measurable levels of TCE and other volatile organic compounds (VOCs). Seven of the 15 wells have shown annual average TCE concentrations greater than EPAs safe allowable limit of 5.0 ppb. Some industrial wells, which yield more than 100,000 gpd and are located within 1 mile west of the well field, have been developed in the same unconsolidated sand and gravel deposits. A two-dimensional, numerical groundwater solute transport model was developed and used to evaluate TCE migration in the groundwater system beneath the well field. The preliminary results indicated locations of potential sources of contamination and indicated that additional monitoring wells should be drilled for data collection. APPROPRIATE METHODOLOGIES FOR DEVELOPMENT AND MANAGEMENT OF GROUNDWATER RESOURCES IN DEVELOPING COUNTRIES. VOLUME III.
Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. 324p. Edited by C. P. Gupta.

Descriptors: *Developing countries, *Geohydrology, *Groundwater management, *Water resources development, *Water resources management, *Workshops, Analytical methods, Groundwater movement, Groundwater potential, Hydrologic models, Management planning, Model studies, Publications, Water demand.

The keynote papers and other significant contributions of an international workshop deliberating on the state-of-the-art techniques in geohydrology and their illustrative applications have been compiled into a series of publications. In the third volume, some of the articles are a critical review/overview of the established techniques, though with a new insight, such as estimation of geohydrological situations. Some others deal with techniques that are known, but not commonly used in geohydrological studies, such as the use of radon in exploration in fractured zones, three-dimensional stochastic modeling for fractured media, and use of cross validation in krigings. The papers have been organized in the same sequence of sessions as in Volumes I and II of this workshop. It is expected that these thought-provoking papers will lead to interactive and purposeful discussions and finally help solidify the operational details, technical guidelines, designs, and practices for hazard-free exploration, exploitation, and management of groundwater resources to meet the ever-increasing demand for water. GEOHYDROLOGIC PARAMETER ESTIMATION: PUMPING TESTS AND TRACER TECHNIQUES.
Birmingham Univ. (England). Dept. of Civil Engineering.
K. R. Rushton.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 1-21, 9 fig, 1 tab, 34 ref.

Descriptors: *Developing countries, *Geohydrology, *Groundwater management, *Hydrologic models, *Model studies, *Parametric hydrology, *Tracers, *Water resources management, Analytical methods, Aquifer characteristics, Aquifer testing, Groundwater movement, Groundwater potential, Management planning, Numerical analysis, Research priorities, Water resources development.

Estimation of the parameters which describe groundwater flow continues to be an important area of research. The recommended approach is to identify the important flow mechanisms before attempting to analyze any pumping tests. In field examples initial studies did not identify the mechanisms that would apply as exploitation of the aquifers developed; for this reason the potential yields of the aquifers were overestimated. It is necessary to carry out controlled tests and select suitable methods of analysis to estimate the magnitude of the aquifer parameters. Numerical analysis is becoming increasingly feasible, since the programs run successfully on microcomputers. The most difficult parameter to estimate is the effective vertical hydraulic conductivity. At present the only reliable method is using carefully-designed pumping tests with analytical or numerical methods of analysis. The development of a more direct method of determining the effective vertical hydraulic conductivity must have a high priority. Tracers are used to learn more about aquifer features, especially the recharge. The techniques which have been developed are reliable and consistent yet there remains the uncertainty as to whether measurements in the unsaturated zone can give reliable information about the quantity of water actually reaching the water table. There are in effect pumping tests and recharge experiments occurring continuously in most aquifers. If records are kept of inflows, well discharges, groundwater hydrographs, and river flows, these can be used with some form of regional or local groundwater model to estimate the important groundwater parameters. PROGRESS AND PROSPECTS IN ENVIRONMENTAL ISOTOPE HYDROLOGY.
Niedersaechsisches Landesamt fuer Bodenforschung, Hanover (Germany, F.R.)
M. A. Geyh.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 23-36, 8 fig, 1 tab, 43 ref.

Descriptors: *Developing countries, *Environmental tracers, *Groundwater movement, *Isotopic tracers, *Tracers, *Water resources development, Analytical methods, Arid-zone hydrology, Groundwater management, Groundwater potential, Hydrologic models, Management planning, Model studies, Radioisotopes, Semiarid lands, Water resources management.

In recent years various techniques based on environmental isotopes have been widely applied in hydrological studies. Most commonly analyzed are the isotope compositions of the environmental radionuclides tritium and radiocarbon as well as those of the stable nuclides of oxygen and hydrogen. The environmental isotope techniques allow determination of the origin of groundwater, its recharge and discharge, quantification of mixtures of different kinds of groundwater, estimation of the age of groundwater, and its movement. New hydrological chronometers such as chlorine-36, argon-39, calcium-41, krypton-81, and krypton-85, as well as the dissolved noble gases, have been introduced during recent years. The dating of groundwater via its dissolved organic carbon compounds seems to be promising. In semiarid and arid zones the estimation of very small evaporation rates from the stable isotope composition of pore water in profiles of the unsaturated zone has become important in groundwater balance studies. There is a trend substituting qualitative for quantitative interpretation of environmental isotope data using mass transport calculations. It has been shown, for instance, that the occurrence of relict resources of fossil groundwater in semiarid zones complicate numerical modeling. Last but not least, long-term monitoring of the isotope composition in groundwater abstracted from production wells may yield recommendations for an optimized groundwater management program. NATURAL RECHARGE OF BASEMENT AQUIFERS IN A SAHEL AND SUDAN CLIMATE: EXPERIMENTAL STUDY IN BURKINA FASO.
Bureau de Recherches Geologiques et Minieres, Orleans (France).
F. Milville, M. Normand, T. Pointet, C. Merlo, and F. Urani.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 47-61, 5 fig, 3 tab, 4 ref.

Descriptors: *Africa, *Burkina Faso, *Developing countries, *Geohydrology, *Groundwater recharge, *Recharge, *Water resources development, Climatic zones, Field tests, Geologic fractures, Groundwater management, Groundwater movement, Groundwater potential, Hydrologic models, Infiltration, Isotope studies, Model studies, Numerical analysis, Water resources management, Water yield.

Two projects have been developed in Burkina Faso, Africa, in order to evaluate by multidisciplinary methods the recharge of basement aquifers in sahelian and sudanese climates, and to perform realistic field tests of exploitation of large yields destined for the irrigation of small areas. The recharge study was carried out on ten pilot stations included within the scope of the first project. Monitoring over a two-year period provided the numerical information required for the constitution and the calibration of combined rain/water level models which allowed the quantitative analysis of the water transit from the surface to the water-saturated underground. Roughly 300 samples were collected for isotope analysis, to attempt dating the water and to study the movement of water masses within the fissured medium. A striking phenomenon of recharge was thus observed and characterized, in both climates concerned. It supposes the infiltration of between 50 and 150 mm of water for the different latitudes in which the tests were conducted. It was also observed that a partitioning effect of the drainage basins into sub-units occurs by water isotopes in particular, which is more and more marked towards the dry zones. This indicates that the aquifers to be exploited in the sahel zones will be even more fragile. (See also W91-03178) (Author's abstract)

HYDROGEOLOGICAL PARAMETER ESTIMATION TECHNIQUES: LOCAL TEST, MODEL FITTING, STOCHASTIC METHODS, AND THE USE OF TRACERS.
Paris-4 Univ. (France).
G. de Marsily, and P. Lachassagne.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 63-75, 49 ref.

Descriptors: *Aquifer testing, *Developing countries, *Geohydrology, *Hydrologic models, *Model studies, *Parametric hydrology, *Water resources development, Analytical methods, Aquifer characteristics, Geostatistics, Groundwater management, Groundwater movement, Groundwater potential, Permeability, Pumping tests, Slug tests, Tracers, Transmissivity, Water resources management.

For most hydrogeological problems the permeability, or transmissivity, of an aquifer is the most important parameter to be determined. To do so, the hydrologist can measure a variety of magnitudes in the field, but he can never directly measure a permeability: he has to rely on a model to interpret the measurements and calculate a permeability or transmissivity. A very large number of models is available, with varying underlying assumptions. It is useful to first define a local parameter value; it is clear then that such local values are frequently highly variable in natural media. One can then try to determine which type of average of these local values is estimated by each method, and what type of average is needed for solving the problem at hand. Geostatistics can be of great help to estimate averages as well as local values at any scale of interest. It is important to apply geostatistics to the correct variable. A slug test or injection test over a small section of a well or piezometer should be considered as the basic method to determine aquifer properties in the field; such tests should then be performed at numerous locations to determine both the type of distribution and the variogram of the local permeability values. In low-permeability media, however, such tests should be continuous, then used to estimate the local transmissivity at the well or the regional transmissivity in the area. Long-term pump tests should be considered as a means to validate the averages which could be obtained from the local measurements. The use of environmental tracers may be helpful as analogs for contaminant transport. (See also W91-03178) (Fish-PTT)

IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 91-106, 7 fig, 1 tab, 11 ref.

Descriptors: *Aeration zone, *Groundwater movement, *Infiltration, *Model studies, *Surface-groundwater relations, *Water resources development, Analytical methods, Developing countries, Flow models, Groundwater management, Groundwater recharge, Hydrologic models, Parametric hydrology, Recharge basins, Unconfined aquifers, Wadi, Water resources management.

The unsaturated zone plays a crucial role in the hydrologic cycle as the link between surface and groundwater. Though there are many aspects to this interaction, examination of a single aspect, that of aquifer recharge, will illustrate nevertheless most essential elements in the linkage. Typically intermittent streams (wadis) and (artificial) infiltration basins are not in permanent hydraulic connection with the underlying water table aquifer. As water becomes available in the wadi or in the basin, infiltration proceeds. Due to the frequent presence of a clogged layer the water flow below the wadi (or basin) bed is unsaturated. Recharge occurs only after the unsaturated wetting front

reaches the water table. On the other hand, long after infiltration has ceased at the soil surface, recharge continues from the unsaturated storage in excess of field capacity, which has accumulated above the water table during the infiltration phase. The three-dimensional character of the flow is rendered by a technique that consists of matching a flow solution in a vertical cross-section with a flow pattern in a horizontal plane. Practical examples illustrate the influence of the parameters on the water table level below the infiltrating area and on the lateral recharge rate into the part of the aquifer which is not overlain by the river or basin bed. Comparison with field observations shows the technique to be accurate, inexpensive, and easy to apply. (See also W91-03178) (Author's abstract)

ESTIMATING GROUNDWATER RECHARGE USING SURFACE AND SOIL WATER BALANCES.
Institute of Hydrology, Powys (Wales).
J. A. Hudson.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 107-137, 5 fig, 90 ref.

Descriptors: *Groundwater recharge, *Hydrologic models, *Model studies, *Recharge, *Surface-groundwater relations, Analytical methods, Great Britain, Groundwater management, Groundwater potential, Hydrologic data collections, Remote sensing, Water resources development, Water resources management.

Groundwater resources in Britain are divided between those in the chalk, limestone, and permotriassic sandstone aquifers of the south and east and the smaller, less continuous, yet locally important drift and gravel aquifers of the upland north and west. Assessment of the worth and sustainable yields of these sources has depended on the development of techniques for estimating the rate of renewal of groundwater by recharge; these methods rely heavily on the use of surface and soil water balances. The framework, if not necessarily the detail, of these methods is of equal relevance to problems of groundwater exploitation in the developing countries. The relative merits of the available physical, mathematical, and chemical techniques suggests that the main objective should be the provision of comprehensive data collection networks for monitoring precipitation, evaporation, soil moisture content and tension, transpiration, soil moisture drainage and streamflow, in order to construct spatially and temporally relevant models of groundwater recharge. Appropriate data is hard to find in developed countries, which generally have a dense hydrometric infrastructure in place, let alone in developing countries where large scale exploitation of resources is only just beginning. Even where reliable, accurate, precise, long-term records are available, the ability to construct physical models is constrained by the lack of information on the spatial variability of vegetation, soils, and groundwater stores. Remote sensing from airplanes and satellites might eventually solve some of the spatial problems, but the techniques are as yet in their infancy. (See also W91-03178) (Fish-PTT)

INTERACTION BETWEEN THE GROUNDWATER AND UNSATURATED SOIL-WATER FLOW REGIONS.
Rothamsted Experimental Station, Harpenden (England).
E. G. Youngs.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 139-154, 2 fig, 39 ref.

Descriptors: *Groundwater movement, *Infiltration, *Recharge, *Soil water, *Surface-groundwater relations, Aeration zone, Analytical methods, Darcys law, Groundwater management, Hydrologic models, Model studies, Physical models, Soil physical properties, Water resources development, Water resources management, Wetlands.

The application of the physics of water movement through soils provides a rational basis for the management and development of water resources. The physics of water movement in saturated and unsaturated soils is used as the basis of a rational approach to problems involving the interaction between the groundwater and unsaturated soil-water flow regions. Two applications were made using physical theory: (1) the effect of evaporation on water table levels in unconfined aquifers under artesian conditions was analyzed; and (2) the movement of water tables in low-lying wetlands as a response to meteorological input was computed. The classical theory used is based on continuum physics embodied in Darcy's law and Richards' equation for flow through inert homogeneous porous materials. However, the classical theory is inadequate in many real situations when there is soil heterogeneity, when there is soil swelling and shrinking, and when there is soil aggregation. To apply the classical theory of soil-water movement, these complications need to be considered when making measurements of soil properties for predicting water flow in soils; measurements of hydraulic soil properties have to sample volumes larger than the soil's representative elementary volume, which can be found only by repeated measurement on different-sized samples. The collection of good field data could remain a major problem in the understanding of the physics of water movement in both saturated and unsaturated soils. (See also W91-03178) (Fish-PTT)

GEOHYDROLOGICAL DATA ACQUISITION: SOME IMPERATIVES.
National Geophysical Research Inst., Hyderabad (India).
C. P. Gupta.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 155-164, 1 fig, 2 tab, 4 ref.

Descriptors: *Data acquisition, *Groundwater data, *Hydrologic data, *Network design, *Water resources development, Databases, Economic aspects, Geohydrology, Groundwater management, Management planning, Water resources management.

There has been a growing realization of the need for a reliable and credible database for an objective and rational management of groundwater resources. The need is felt all the more strongly in developing countries where the demand on groundwater resources has been incessantly mounting due to a fast growth of population and increased agricultural activities. The objective of a geohydrological data acquisition system (GDAS) is the generation of an appropriate database which could be transformed into a meaningful information system for a hazard-free development of groundwater resources. The design of a GDAS should take into account (1) essential features of the geohydrological regime, (2) specific needs of the users, an (3) the available financial resources for the establishment, operation, and management of the system. Standardization of the methodology and unrestricted accessibility to the database are other prerequisites for communication and meaningful utilization of the geohydrological data. GEOHYDROLOGICAL DATA BASE FOR WATER MANAGEMENT.
Jawaharlal Nehru Technological Univ., Hyderabad (India).
B. H. Briz-Kishore.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 165-174, 4 fig, 2 tab, 6 ref.

Descriptors: *Computer models, *Data storage and retrieval, *Databases, *Groundwater management, *Hydrologic data collections, *Water resources development, *Water resources management, Data processing, Data requirements, Developing countries, Economic aspects, Management planning, Social aspects.

Effective water management acts as a catalyst for extensive socioeconomic development and administrative policy modernization. The extent of modernization depends upon the stimulating impact of the data processing itself, and it is in this sense the geohydrological database development, as part of the water management process, becomes one of the most crucial building blocks of public administration. It is well-known that the data required for different applications in water management is copied from original field records several times. This kind of data-copying results in the redundant storage of data under the same processing environment. Conventional methods involving different physical file structures pose severe limitations such as rigidity for carrying out any extensions and necessity for frequent reorganization. Hence it is essential to formulate an efficient data storage and interaction mechanism removing all the prevailing lacunae and limitations of conventional methods of storage through recently-emerging database systems. A computerized database will provide integrated information on mass balance at any point of time for pragmatic planning, efficient execution, and serious monitoring of several socioeconomic schemes for the benefit of the society. The system can be operated even by nontechnical persons and is capable of responding to several queries simultaneously to stimulate the information through graphic outputs, when well-defined documentation is available. 3-D STOCHASTIC DISCRETE FRACTURE NETWORK MODEL FOR SIMULATING FLOW AND TRANSPORT THROUGH FRACTURED MEDIA.
Ecole Nationale Superieure des Mines de Paris, Fontainebleau (France). Centre d'Information Geologique.
M. C. Cacas, E. Ledoux, G. de Marsily, and B. Tillie.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 175-197, 11 fig, 1 tab, 25 ref.

Descriptors: *Flow models, *Fracture permeability, *Geologic fractures, *Groundwater management, *Groundwater movement, *Hydrologic models, *Model studies, *Water resources management, Analytical methods, Channel flow, Flow rates, France, Hazardous waste disposal, Hydraulic conductivity, Hydrologic data, Stochastic models.

A large-scale investigation of fracture flow was recently conducted in a granite uranium mine at Fanay-Augeres, France. Its aim was to develop a methodology for the investigation of possible nuclear waste repository sites in crystalline environments, and thus to determine what measurements to make, and what models to use in order to predict the flow rate in the medium. Four types of data were collected: (1) geometry of the fracture network; (2) local hydraulic properties measured by injection tests in boreholes; (3) global hydraulic behavior from flow rate and piezometric head distribution; and (4) tracer tests. A stochastic fracture network model was developed. The fractures are represented by geometrical discs. The flow through the disc network is simulated by assuming that it occurs through small 'channels.' The model calibration consisted in adjusting the local channel hydraulic conductivities. The model was then used to predict the global hydraulic behavior. This attempt to validate the parameters and the model structure appeared to be positive. A particle trans-

port simulator was coupled to the flow model, based on a particle-following method using the advection-biased random-walk technique. Microscopic dispersion in the fractures and slowing-down effects due to unevenness of the flow paths were taken into account. The transport model was calibrated on tracer tests. The model appears to be able to account for the large-scale channeling phenomenon observed in situ. Moreover, its dispersive properties controlled by the network geometry and the hydraulic conductivities assigned to its flow elements are reasonably comparable to those of the real site. NEW APPROACH TO TRACER TRANSPORT ANALYSIS: FROM FRACTURE SYSTEMS TO STRONGLY HETEROGENEOUS POROUS MEDIA.
California Univ., Berkeley. Earth Sciences Div.
C. F. Tsang.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 199-222, 15 fig, 30 ref. DOE contract number DE-AC03-76SF00098.

Descriptors: *Fracture permeability, *Geologic fractures, *Hydrologic models, *Tracers, Flow models, Groundwater management, Groundwater movement, Groundwater transport, Model studies, Paths of pollutants, Permeability, Water resources development, Water resources management.

In the utilization and management of groundwater resources, a problem that has come into increasing attention in both developed and developing countries is the need for monitoring and maintaining groundwater quality. Many current developments and utilizations of groundwater resources include a study of their flow and transport properties. These properties are needed to evaluate possible changes in groundwater quality and potential transport of hazardous solutes through the groundwater system. Investigation of transport properties of fractured rocks is an active area of research. Most of the current approaches to the study of flow and transport in fractured rocks cannot be easily used for analysis of tracer transport field data. A new approach is proposed based on a detailed study of transport through a fracture of variable aperture, a two-dimensional strongly-heterogeneous permeable system. Tracer breakthrough curves can be analyzed based on an aperture or permeability probability distribution function that characterizes the tracer flow through the fracture. The results may be extended to a multi-fracture system and can be equally applied to a strongly-heterogeneous porous medium. The need for multi-point or line and areal tracer injection and observation tests is a way to avoid the sensitive dependence of point measurements on local permeability variability. NUMERICAL GROUNDWATER QUALITY MODELLING: THEORETICAL BASIS AND PRACTICAL APPLICATIONS.
Gesamthochschule Kassel (Germany, F.R.).
W. K. H. Kinzelbach.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 223-241, 8 fig, 28 ref.

Descriptors: *Flow models, *Groundwater movement, *Hydrologic models, *Model studies, *Path of pollutants, *Solute transport, Analytical methods, Aquifer characteristics, Dimensional analysis, Dispersion, Management planning, Stochastic models, Water resources development, Water resources management.

The types of problems requiring models of the transport of pollutants and their transformation in the saturated zone include: data interpretation; understanding of mechanisms of transport and reactions; estimation of pollutant degradation rates and concentrations; identification of major pollutant sources; and various management planning alternatives. The basis for any model is the mass balance equation in its differential form. Three levels of solving the transport equation can be distinguished: analytical solutions, pathline solutions, and full numerical solutions. Any real world problem is spatially three-dimensional and time-dependent. Yet, approximations in lower spatial dimensionality (i.e. zero-dimensional models, one-dimensional models, horizontally two-dimensional models, and vertically two-dimensional models) are often feasible. The modeling of macrodispersion in the non-asymptotic stage is as yet an unsolved and maybe unsolvable problem. The use of Fickian dispersion models with constant dispersivities is a crude tool only in which the dispersivities are mere fitting parameters. Stochastic techniques are still in the developing phase and more field validations are called for before they can be used on a routine basis in practical aquifer contamination problems. Modeling of chemical processes in aquifer materials remains inherently a complicated task, since the possible number of reaction processes and participating constituents are large. The modeling of flow and transport requires a large amount of data. Usually only a few of these are readily available; some must be estimated by means of a properly-calibrated model. APPROPRIATE METHODOLOGIES FOR DEVELOPMENT AND MANAGEMENT OF GROUNDWATER RESOURCES IN DEVELOPING COUNTRIES.
Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. 541p. Edited by C. P. Gupta.

Descriptors: *Developing countries, *Groundwater management, *Groundwater resources, *Water resources development, *Water resources management, Aquifers, Geologic fractures, Groundwater pollution, India, Model studies, Workshops.

Groundwater resources increasingly are being tapped to meet societal needs. However, it is important to recognize that, although groundwater has ubiquitous occurrence and vast magnitude, its potential as a perennial source is subject to wide spatial and temporal variations. It is renewable, but not inexhaustible and, although it is underground, it is not entirely protected from pollution. This second volume of the proceedings of Workshop IGW-89 considers state-of-the-art techniques for geohydrological parameter estimation, data acquisition, analysis of flow in unsaturated zones, studies of contaminant migration, and augmentation of groundwater. Appropriateness of the techniques for use in developing countries is emphasized in many presentations. Specific sessions covered in volume 2 are: management of groundwater resources, particularly in hard rocks (parameterization of groundwater flow regime, modeling of complex aquifers, simulation of flow in fractured rocks, and assessment of dynamic potential of aquifers); pollution of aquifers (groundwater quality modeling, modeling of migration of non-reactive/reactive chemicals, radioactive nuclear waste, and remedial measures); and augmentation of water resources (artificial recharge, rainwater harvesting, and constraints and limitations). IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 485-498, 6 fig, 17 ref.

Descriptors: *Aquifers, *Geologic fractures, *Groundwater movement, *Mathematical models, *Model studies, *Simulation, Groundwater pollution, Indian Institute of Science, Path of pollutants, Reviews, Solute transport.

Mathematical models of groundwater resources have been applied successfully in various situations, but controversy remains concerning the applicability of porous media flow concepts in hard rock aquifers. The obvious differences between hard rock formations and the simple grains-pores picture, as well as the presence of mechanical discontinuity, have raised basic questions. Groundwater flow simulation models for fractured rock aquifers are reviewed here under four categories: (1) fracture-based models; (2) equivalent porous medium models; (3) double porosity models; and (4) leaky aquifer models. The fracture-based models require detailed field data, which can be obtained only on a large scale. Hence these models may be more suited to oil well applications and studies of hazardous contaminant transport, such as nuclear waste. The double porosity models may be more relevant for groundwater applications., particularly well hydraulics. The leaky aquifer model with an aquifer-water table-aquitard system has conceptual similarity with the double porosity model. A general two-domain model that allows lateral and vertical flow in the water table domain, flow transfer between the domains, and considers the effects of anisotropy, well storage, and partial penetration may represent groundwater flow in a fractured rock system. Such a model has the advantage that it can be applied for dug wells or bore wells and, with some simplifications, can be used for regional applications. Numerical solutions have been obtained recently at the Indian Institute of Science for models incorporating some additional simplifications of this general two-layer system. NONDEFEATIST DERIVATION OF FINITE DIFFERENCE SCHEMES.
Roorkee Univ. (India). Dept. of Earth Sciences.
P. S. Moharir.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 499-504, 8 ref.

Descriptors: *Finite difference methods, *Groundwater movement, *Mathematical models, *Model studies, Differential equations, Mathematical equations, Performance evaluation.

Groundwater modeling requires solving a partial differential equation subject to initial and boundary conditions. In finite difference modeling, first the derivations are replaced by suitable finite difference approximations, and then the resultant numerical scheme is tested for stability. Although it seems natural to try to improve the approximation in the first stage, it is well established that a more accurate finite difference approximation for the derivatives does not imply automatically a stabler finite difference scheme. The two-stage procedure therefore must be regarded as defeatist, because under it the outcome of the second stage is seen as inevitable and when the result is unfavorable the scheme is abandoned. A nondefeatist approach recommends that the twin objectives of stability of the finite difference scheme and the accurate approximation of the net differential operator be dealt with simultaneously. Both explicit and implicit examples are offered. Besides being a pedagogically preferable method for derivation of finite difference schemes, the method has other advantages. The method explicitly shows compromises that must be made in the condition of unbiasedness, proper diffusivity, and good convergence. Also, the method is very general. HYDROGEOLOGY OF THE MIDDLE CHELIFF BASIN (ALGERIA): SIMULATION OF GROUNDWATER FLOWS.
Neuchatel Univ. (Switzerland). Center of Hydrology.
M. Bouzelboudjen, and J. Mania.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 505-521, 8 fig, 2 tab, 11 ref.

Descriptors: *Algeria, *Geohydrology, *Groundwater movement, *Model studies, Aquifers, Cheliff River, Developing countries, Hydrologic models, Mathematical models, Middle Cheliff Basin, Simulation, Surface-groundwater relations, Water demand, Water resources development.

The hydrologic analysis of the alluvial plain of the Middle Cheliff basin (Algeria) permits the successive definition of the boundaries of the alluvial reservoir and the associated sandstone formations, the aquifer geometry, and the hydrologic budget. It appears that the aquifer deposits are thick (100-180 m) on the right bank of the Cheliff River, with the presence of sedimentary deposition gaps (Pliocene-Miocene) in the meridional part of the basin. The utility of the mathematical model based on the finite element method, with steady state conditions, can justify the working hypothesis, with an improvement of the knowledge of hydraulic characteristics of the aquifer and the calculation of complete hydrologic balance. It shows that the effective precipitation and the surface waters of the Cheliff stream represent 40% and 22% of the inputs, respectively. A second simulation based on the finite difference method, with unsteady conditions, leads to the evaluation of the values of specific yield and the determination of the impact of irrigation on the piezometric evolution of the water table. The total requirement of 37 cu hm for the year 2000, with 16.6 cu hm for potable water, 18.4 cu hm for agricultural water, and 2 cu hm for industrial water, cannot be satisfied by pumping only from the aquifer. ROLE OF VERTICAL FLOW IN SEDIMENTARY AQUIFERS.
Birmingham Univ. (England). Dept. of Civil Engineering.
K. R. Rushton, and M. Thangarajan.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 523-538, 8 fig, 7 ref.

Descriptors: *Aquifers, *Geohydrology, *Groundwater mining, *Groundwater movement, *India, *Pumping, *Vertical flow, Hydrologic models, Model studies, Sedimentary basins, Water demand.

In attempting to understand the responses of sedimentary aquifers to pumping, it is essential to recognize that vertical as well as horizontal flows can occur. Three case studies in India of deep aquifers, from which substantial quantities of water are being abstracted, demonstrate the methods of identifying the presence of both horizontal and vertical flows. Methods of quantifying the vertical flows are introduced. The three aquifers in which vertical flows can be demonstrated are Mehsana, Madras, and Neyveli. Five indicators of vertical flows have been recognized: (1) overflowing wells and springs or high piezometric heads occurring prior to the exploitation of the aquifer; (2) falling piezometric heads and reduction in flow in perennial rivers; (3) increasing pumped drawdowns due to increasing abstraction; (4) continuing long-term fall in the water table elevation; and (5) evidence of vertical flows derived from tracer studies. Vertical flows can be quantified by three different methods: using Darcy's law, examination of a typical cross section, and use of numerical models. In each of the three aquifers considered here, it was originally assumed that groundwater originated from an up-dip recharge area. In the undisturbed state, this was a valid assumption about the conditions within the aquifer. However, heavy exploitation of the aquifers meant that the horizontal flows from the recharge zones no longer were sufficient to meet the demands and vertical flows became important. ESTIMATING GEOHYDROLOGIC PARAMETERS FOR GROUNDWATER MANAGEMENT AND LAND SUBSIDENCE CONTROL IN KANTO PLAIN, JAPAN.
National Geophysical Research Inst., Hyderabad (India).
N. Shibasaki.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 539-544, 3 fig, 4 ref.

Descriptors: *Geohydrology, *Groundwater management, *Japan, *Model studies, *Subsidence, Finite element method, Hydrologic budget, Kanto Plain, Mathematical models, Optimization, Pumping tests, Simulation, Statistics.

Kanto Plain, central Japan, is one of the largest plains in Japan; it has been urbanized since the 1950s. Detailed geohydrological investigations were carried out in the Kanto Plain for basin-wide groundwater management and to evolve appropriate strategies for prevention of land subsidence. Geological and hydrogeological studies/analyses were carried out to construct computer simulation models. Geohydrologic parameters were estimated by statistical analyses using pumping tests/routine production tests of water wells and soil test data. The calculated groundwater level and land subsidence obtained with the vertical two-dimensional, multi-aquifer model using the finite element method agreed satisfactorily with the observed values. The water balance and land subsidence studies, which were based on accurate geological and hydrogeological studies/analyses, have helped greatly in evolving optimal exploitation schemes for this area. Descriptors: *Groundwater recharge, *India, *Model studies, *Pumping, *Simulation, *Water level fluctuations, *Water table, Groundwater potential, Hydrologic models, Mahi Right Bank Canal Command Area, Mathematical models, Prediction, Statistics, Water resources development.

A groundwater basin simulation model was used to predict the dynamic behavior of the water table in response to groundwater pumpage and net recharge in part of the Mahi Right Bank Canal (MRBC) command area, Gujurat, India. The model is based on a finite difference approach and uses an iterative alternating direction implicit technique as the solution procedure. The model was calibrated and validated by using historical input data. Some statistical parameters such as the mean, standard deviation, coefficient of correlation, and a non-parametric statistical test were used to study the extent of agreement between the observed and the predicted water table depths. No significant difference was found between the distribution of the observed and the predicted water table depths at the 95% confidence level. Net recharge to the groundwater basin was calculated and used for determining additional groundwater potential. The additional groundwater potential available for development in the area is about 265 million cubic meters, which is about 1.6 times the existing level of groundwater development. Sufficient scope exists for a substantial increase in groundwater development. (See also W91-03311) (Author's abstract)

IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 595-606, 6 fig, 1 tab, 6 ref.

Descriptors: *Germany, *Groundwater movement, *Model studies, *Numerical analysis, *Simulation, *Water table fluctuations, Hydrologic budget, Mathematical models, Prediction, Spatial distribution, Temporal distribution, Water level fluctuations.

Groundwater is the main source of water supply to Hanover City (Germany); much of it is obtained from Fuhrberg field. A mathematical model was employed to simulate dynamic behavior of the water table in response to recharge, pumpage, and interaction with a river in Fuhrberg field. An area of 372 sq km, with a maximum extension of 26 km (E-W) by 18 km (N-S) was considered in the

analysis. Water balance analysis was conducted for a period of 14 yr and the model was used to predict the spatio-temporal distribution of the water table in response to proposed pumping and artificial recharge schemes. Based on use of the model, the following conclusions were drawn: (1) good agreement exists between computed and measured water table heights, confirming the validity of the model for simulation in this study area; (2) groundwater flow during the period of investigation (April 1968 through April 1982) exhibited a state of balance; and (3) prediction results indicate an increase in aquifer storage, which leads to a rise in the water table. C. P. Gupta, M. Thangarajan, V. V. S. Gurunadha Rao, N. K. Balasundar, and S. Muthuram.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 607-618, 10 fig.

Descriptors: *Aquifers, *Groundwater movement, *India, *Mining effects, *Model studies, Geohydrology, Hydrodynamics, Hydrologic models, Leaky aquifers, Lignite, Mathematical models, Neyveli aquifer, Regional analysis, Simulation, Surface-groundwater relations.

The groundwater flow regime in the Neyveli basin (Tamilnadu, India) has been perturbed due to groundwater withdrawals from lignite mines and a large number irrigation wells in the area. The available geohydrological data were analyzed thoroughly for the conceptualization of the complex aquifer system. Both two-dimensional and three-dimensional mathematical models were constructed and aquifer modeling was used to obtain a first-order quantitative understanding of the vertical flows and aquifer-river interactions in the basin. The leakage from the phreatic aquifer into the groundwater regime below the lignite seam contributes significantly toward controlling the hydrodynamics of the region. The model studies also helped in the design of field experiments for better quantification of spatio-temporal variations of geohydrological parameters. (See also W91-03311) (Author's abstract)

COMPARATIVE MODEL STUDY FOR GROUNDWATER RESOURCES EVALUATION IN KELANTAN, MALAYSIA: PART 1. MODEL EVALUATION.
National Univ. of Malaysia, Bangi.
S. Awadalla, I. M. Noor, and I. Ibrahim.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 619-627, 8 fig, 6 ref.

Descriptors: *Groundwater management, *Groundwater resources, *Hydrologic models, *Malaysia, *Model studies, *Water resources development, Aquifers, Developing countries, Observation wells, Piezometric head.

The increasing demand for water supply in Kelantan state, Malaysia, has created an increased need for evaluation, development, and management of groundwater resources. On the basis of recent hydrological investigations and available data on groundwater exploitation in Kelantan, a two-dimensional numerical groundwater model was developed to simulate the present situation and the possible future development of groundwater resources in the area. An optimum set of input data and parameters covering an 11-yr period were used to obtain simulated head values. A good agreement was obtained between these values and observed heads where the differences are quite minor. However, at certain nodes or areas of the aquifer, the computed values had distinct differences from the values measured in the field. Since the grid size for a particular node is quite large (5 km), the representation of the aquifer conditions at the observation wells is restricted. The average parameters and data represented may not be accurate enough to predict the heads at the wells. Nevertheless, the computed values compared quite well with the observed heads and the trends over time are similar. (See also W91-03311) (Rochester-PTT)

Descriptors: *Groundwater mining, *Groundwater movement, *India, *Model studies, *Water resources development, Computer models, Groundwater resources, Hydrologic models, Mathematical models, Semiarid lands, Surface-groundwater relations, Tambraparni River, Water demand.

The Tambraparni River basin lies in the arid to semiarid climatic zone of India and receives an average annual rainfall of 88 cm. Groundwater occurs mainly under unconfined conditions in the weathered and fractured zones of the crystalline formations. The Tambraparni River is perennial at the present time. A two-dimensional, finite difference computer model was developed to model the groundwater flow of the Tambraparni River basin and was used as a predictive tool. Groundwater potentials were forecast under (1) normal, existing conditions and (2) with a limited stress of 1% increase in the amount of extraction per year up to 1991. The zones of depletion due to the proposed stress and the ultimate effects on groundwater exploitation schemes were inferred. Unwarranted mining of groundwater changes the entire effluent river system into an influent one by 1991. Based on the model results, it is concluded that overexploitation of any groundwater resource should be stopped. (See also W91-03311) (Author's abstract)

EXPLORATION AND DEVELOPMENT OF GROUNDWATER IN THE CRYSTALLINE ROCKS.
Tribhuvan Univ., Kathmandu (Nepal). Central Dept. of Geology.
G. Krishna Rao.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 641-648, 11 ref, 2 plate.

Descriptors: *Geohydrology, *Geologic fractures, *Groundwater potential, *Groundwater resources, *India, Crystalline rocks, Developing countries, Mineralogy.

Crystalline rocks, which constitute a major part of peninsular India, account for nearly 40% of the total aquifer extent in the country. Further irrigation potential of the country depends on understanding these complex aquifers. Field observations in different parts of Andhra Pradesh and Karnataka states revealed that the behavior of different rock types, felsic to mafic, in response to tectonics and weathering differs. Fracture intensity is highest in quartz veins, followed by granites and granitic gneisses and related rocks. Mafic rocks generally are massive with sporadic fracturing. Similarly, the weathered residue from the felsic rocks is relatively more permeable than that from the mafic rocks. The quartz content in crystalline rocks plays a vital role in making them potential aquifers. The weathered residue of quartz-rich felsic rocks would be relatively more permeable than the quartz-poor mafic or basic rocks. Similarly, quartz veins or quartzites and felsic rocks are more brittle than the mafic rocks and hence develop more fracture intensity. In this area, groundwater exploration and development is recommended for the quartz veins and felsic rocks rather than in mafelsic and mafic rocks. (See also W91-03311) (Rochester-PTT)

IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 661-668, 4 tab, 11 ref.

Descriptors: *Arid lands, *Drought, *Geohydrology, *Groundwater mining, *Groundwater potential, *Groundwater resources, *Kenya, Comparison studies, Data acquisition, Developing countries, Geophysical methods, Lithologic logs, Sand rivers, Stratigraphy, Tana River, Well logs.

Groundwater resources of the sedimentary basins of eastern Kenya were assessed. The sediments were laid down between Paleozoic and Quaternary periods. The area is generally drought-stricken and comprises nearly two-thirds of the total area of the country. The mean rainfall decreases while the rate of potential evapotranspiration increases going northward and eastward. Aridity of the area results from high temperature combined with lack of vegetative cover. The region is drained by sand rivers, except for the Tana River, which runs along the southern boundary. Several geophysical methods were employed with differing success rates. Because of the remoteness of the area, well logging was the most useful method for reconstructing the stratigraphy. Preliminary investigation on the nature of lithologic logs shows that three types of geological terranes within the sedimentary basins of the area have potable water. The first is Pliocene and Quaternary deposits comprising the unconsolidated or poorly consolidated sand and gravel, commonly interbedded with clay. The second terrane consists of semi-consolidated and consolidated agglomerate, sandstone, or shale formations, which are often joined and possess intergranular and fracture porosity and permeability. The third geologic terrane comprises limestone and gypsum beds, which generally contain saline water, largely calcium sulfate. Further research is needed to demarcate these and other geologic terranes in the country. (See also W91-03311) (Author's abstract)

GONDWANA ARTESIAN BASIN IN WEST GODAVARI DISTRICT, ANDHRA PRADESH, INDIA.
B. J. Kumar, K. V. S. Sastry, and K. V. R. J. Krupanidhi.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 669-672, 2 fig.

Descriptors: *Artesian basins, *Geohydrology, *Groundwater mining, *Groundwater potential,

*Groundwater resources, *India, Aquifers, Conjunctive use, Irrigation water, Potentiometric surface, Water resources development, Wells, West Godavari District.

The Central Ground Water Board (CGWB) of India carried out groundwater exploration during the period 1967 to 1972 in the Gondwana basin and identified potential aquifers down to a depth of 300 m. With increased irrigation demand, the CGWB extended its activity to the adjacent areas to explore the possibility of locating deeper Gondwana aquifer systems underlying the younger formations. During the period 1977 to 1984, exploration was carried out down to a depth of 600 m, proving the existence of deeper potential aquifers in Gondwana formations of this district. The Deccan traps form an ideal confining layer for the underlying Gondwana formations, resulting in free-flowing conditions for wells tapping deeper Gondwana aquifers. Granular zones exist from 100 to 260 m down to the explored depth (600 m). The yields from these granular zones range from 3700 to 6000 lpm for varying drawdowns of 19 to 25 m. The average permeability of these granular zones is 10 m/day. The elevation of the potentiometric surface of these aquifers varies from 4 to 25.5 m above ground level, with a gradient of 1 in 200 towards the southeast. These deeper, high-potential aquifers extending from Eluru to Tadepalligudem can be tapped by a battery of heavy-duty tubewells. The free-flowing area between Muppavaram and Kaikaram, near the end of the Eluru canal, can be taken up for conjunctive use of surface and ground waters. Groundwater potential of 83 million cu m is estimated to occur in this area and it can be exploited by constructing 150 tubewells. (See also W91-03311) (Rochester-PTT)

Descriptors: *Drought, *Geohydrology, *Groundwater resources, *India, *Water resources development, Chandrapur District, Developing countries, Domestic water, Rural areas, Water supply development, Well logs.

Well logging was conducted in Maharashtra state, India, in response to the drought of 1987-1988. Existing well data were analyzed in relation to rock structure, and sites were selected for wells in the district. In this district, the groundwater resource is the only major source meeting the needs of all water supply schemes in the rural areas. Based on the available data and with proper planning, the program of construction of tubewells in the Gondwana formations has proceeded well. Out of 27 sites selected in the Gondwana formations, 26 tubewells were constructed successfully. Construction of tubewells in Talchir formations, which had not been attempted previously in this district, proved successful in providing domestic water supply. Out of 121 sites selected in Chandrapur district, 51 sites were selected for construction of borewells in the hard rock area. Borewells have been drilled at 24 sites. At Devai, one borehole was abandoned and three borewells were dry at the time of construction. Future groundwater studies should help to meet the needs for village water supplies free from pollution and contamination. (See also W91-03311) (Rochester-PTT)

Descriptors: *Aquifers, *Geohydrology, *Groundwater resources, *India, Barmer district, Confined groundwater, Developing countries, Perched groundwater, Remote sensing, Sandstones, Satellite technology, Water table.

In the Mesozoic super group identified in the Barmer district (India), there are two characteristic groups of fresh water bearing formations: Lathi sandstone of Jurassic age and the Cretaceous Barmer sandstone. Recent studies by satellite imagery have defined better the extent of these formations. As a result of intensive work carried out in the period 1952-1964 and subsequently, the Lathi-Barmer formations have been recognized as the most dependable formations in the district. Groundwater occurs in them under perched, phreatic, and confined conditions, the last varying in depth, aggregate thickness, and coarseness of the formation. The phreatic surface ranges from 27 to 75 m below ground level, whereas the piezometric surface ranges from 32 to 92 m. The discharges obtained from boreholes tapping 18-40 m thickness of granular zones range from 6 to 20 L per sec for a drawdown range of 2-15 m. While the specific capacity ranges from 25 to 750 L/min/m of drawdown, the transmissivity ranges from 90 to 1170 sq m/day and hydraulic conductivity from 5 to 32 m/day. INDRAVATI-KOLAB BASINS OF KORAPUT AS POTENTIAL GROUND WATER RESERVOIRS OF THE PURANAS IN ORISSA.
National Environmental Engineering Research Inst., Nagpur (India).
P. G. Adyalkar.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 681-684, 6 ref.

Descriptors: *Geohydrology, *Groundwater potential, *Groundwater reservoirs, *Groundwater resources, *India, Developing countries, Drawdown, Geologic fractures, Groundwater basins, Groundwater movement, Hydraulic conductivity, Indravati-Kolab basins, Koraput District, Limestone, Specific yield, Well yield.

The Indravati-Kolab (Sabari) basins of Koraput district in Orissa (India) continue with the identical basins of the same name downgradient in Bastar district of the Chhattisgarh region of Madhya Pradesh. The sandstones, quartzites, and conglomerates of the Purana sequence are poor and problematic aquifers with occasional networks of four or more joints, including a master joint. Such networks of joints extend in depth to 30-60 m. The Kanger calcic limestone is flaggy, but the Jagdalpur magnesian stromatolitic limestone is heterogeneous, resulting in classic development of karst in the Indravati-Kolab basins of Koraput district. With average rainfall in the range of 170-190 cm, wells in the micro-alluvial valleys and karst often are limited to 12 m in depth. Individual tubewells, 90 m deep, are capable of yielding 5-8 L/sec for a drawdown of 6 m, the piezometric zone being 4.5-15 m below ground level. The specific capacity ranges from 50 to 150 L/min/m of drawdown and yield potential is 150-300 cu m/day for a drawdown of 5-10 m, when developed under strict hydrogeologic control. The hydraulic conductivity ranges from 5-10 m/day and the specific yield is 3-8%, with a spacing pattern of 250 m. Laterites, although of limited extent, are of great significance from the point of view of the occurrence of seeps and springs in the highland areas and the richness of the groundwater potential. GROUND WATER FLOW IN SOUTHERN PART OF KOSI ALLUVIAL FAN AND ITS EFFECT ON WATERLOGGING, WITH POSSIBLE REMEDIAL MEASURES, DISTRICT SAHARSA, BIHAR, INDIA.
Central Ground Water Board, Patna (India).
P. N. Singh.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 689-697, 3 fig, 1 tab, 2 ref.

Descriptors: *Alluvial aquifers, *Groundwater movement, *India, *Waterlogging, Alluvial fans, Flood control, Kosi River, Kosi District, Water table rise.

Groundwater flow along the ground slope and waterlogging are common in the Kosi district alluvial fan area (India). The shallow depth to water table with phreatic conditions within the sandy aquifer indicate a groundwater surplus. A water table map was prepared based on field studies with the aim of explaining the cause of waterlogging. Water from seepages forms the headwaters of a new stream or accumulates in low-lying areas leading to waterlogging. The continuous groundwater flow is maintained by the influent condition of the Kosi River in its upper reaches. Depth to water table data for 7 yr does not indicate any appreciable rise or difference in water level, even during years of scanty rainfall, and no marked difference in water level has been noticed. The only rise of depth to water table has been recorded in the area along an unlined canal, which is one of the major causes of waterlogging in the area. Among the measures considered for dealing with the waterlogging problem are construction of fish ponds to decant the groundwater from the adjoining land, thus lowering the water table and removal of silt from the river to both lower the water table and improve flood control. SELECTING EFFECTIVE METHODS FOR GROUNDWATER PROSPECTING AND EXPLORATION IN MEKONG DELTA.
General Department of Mine and Geology, S. R. Vietnam.
B. X. Pham.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 701-708.

Descriptors: *Data acquisition, *Geohydrology, *Groundwater mining, *Groundwater potential, *Vietnam, *Water resources development, Aquifers, Developing countries, Field tests, Geophysical surveys, Hau River, Mekong River, Saline groundwater.

In the Mekong delta (Vietnam), groundwater for domestic and industrial uses could be exploited from young sedimentary formations of Cenozoic age. Hydrogeologically these sedimentary formations are very complex and exhibit an irregular distribution of hydrochemical zones. The fresh water-bearing layers are inter-related with saline ones, especially in the region lying between the Tien (Mekong) River and Hau (Bassac) River. Using well drilling and pump test projects for groundwater prospecting as in the past is very expensive and at times has not fully satisfied the

technical requirements. Among new approaches, geophysical methods are being used exclusively for studying fluctuations in level and to determine saline-fresh water boundaries. Since 1980, dozens of regions in the Mekong delta, with average areas of 400-600 sq km, have been explored, with the drilling of hundreds of boreholes with a total length of nearly 100,000 m. Analysis of research needs for this area shows several points: (1) two research stages, prospecting and exploration, are more appropriate than the presently employed three stages (prospecting, preliminary exploration, and detailed exploration); (2) only simple lines of boreholes are employed during the prospecting stage in order to determine the boundaries of the fresh water-bearing formations; (3) increase the application of geophysical methods; (4) thoroughly exploit existing observational data on surface water and groundwater movements as a way of calculating the regime of the various aquifers; (5) apply hydrogeochemical methods more effectively to determine groundwater quality; and (6) employ aerial photography to determine the region's general structure and the smaller structures, with the aim of forecasting groundwater distribution according to area and depth. DROUGHTS AS MEANS OF DELINEATION OF AREAS PRONE TO SEA WATER INTRUSION.
National Geophysical Research Inst., Hyderabad (India).
B. S. Sukhija, D. V. Reddy, and I. V. Reddy.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 733-741, 4 fig, 1 tab, 4 ref.

Descriptors: *Drawdown, *Drought, *Groundwater movement, *India, *Saline water intrusion, Groundwater mining, Hydraulic gradient, Pondicherry, Potentiometric surface.

Over-exploitation of groundwater along the coast may result in declining water levels accompanied by the reversal of hydraulic gradient. Work was undertaken in Pondicherry (India) and its surrounding areas with the aim of demonstrating that the comparative study of groundwater levels, groundwater flow, and gradients of normal rainfall, drought, and excessive rainfall could be used to delineate areas prone to sea water encroachment. Drought affects water level in two ways: (1) by reducing recharge and (2) extending the period of agricultural use for irrigation, thus further dropping the mean groundwater level. Using 1979 as the base year, it is shown that groundwater withdrawal increased substantially (to 1.5 times input) during the period 1980-1981 and 1982-1983, resulting in an average decline in groundwater levels of 7 m in the study area. The changes in the shape of the potentiometric surface over this period resulted in reversals of groundwater flow direction from uniformly toward the Bay of Bengal to landward in a few areas, creating areas prone to sea water intrusion. IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 743-753, 3 fig, 2 tab, 10 ref.

Descriptors: *Geochemistry, *Groundwater chemistry, *Groundwater quality, *Tanzania, *Water quality, Classification, Coastal areas, Dar Es Salaam, Indian Ocean, Potable water, Public health, Sulfates.

Groundwaters near Dar Es Salaam (Tanzania) were sampled and chemically classified. Water types identified were sodium bicarbonate, sodium sulfate, sodium chloride, calcium bicarbonate, and magnesium bicarbonate. Hydrochemical facies change from calcium-sodium facies near the shore of the Indian Ocean to sodium-calcium facies landward and from chloride-sulfate-bicarbonate to bicarbonate-chloride-sulfate. Dissolution of dolomitic limestone, cation exchange, and mixing of fresh recharge water with interstitial marine water, in addition to dissolution of airborne salts, are the major processes responsible for the chemical character of the water. Using the World Health Organization and United States Geological Survey diagrams, water quality was assessed and recommended as suitable for domestic and irrigation uses. In one area, sulfate exceeds the limits of the WHO guidelines. (See also W91-03311) (Rochester-PTT)

Descriptors: *Geochemistry, *Geohydrology, *Groundwater chemistry, *India, *Mathematical models, *Model studies, *Water chemistry, Calcium, Carbonates, Cations, Chlorides, Classification, Dissolved solids, Electrical conductivity, Hydrogen ion concentration, Multiple regression analysis, Principal component analysis, Sulfates, Tamilnadu.

Identification, classification, and interpretation of hydrogeochemical facies normally are attempted through graphical representation. Developmental planning of groundwater resources requires a complete picture/model of the major ion characteristics. Factor, principal components, and multiple regression analyses were adopted to develop deterministic and predictive hydrochemical models for the groundwaters of Tamilnadu (India). The deterministic model could show the principal chemical components of aquifers, their pattern of distribution, and the residence time of groundwaters in aquifers. Results of the predictive model could reduce the cost of chemical analysis of sequential water samples normally conducted in a groundwater system. Studies were conducted in two river basins, the Tambraparni and the Vaigai. For the Tambraparni, the dominant factors were: (1) Cl, electrical conductivity (EC), Ca, and total dissolved solids (TDS), with 61.03% of the variance; (2) CO3, pH, SO4, and Na + K, with 75.47% of the variance, and (3) HCO3, Na + K, and TDS, with 85.06% of the variance. For the Vaigai, the principal components were: (1) Cl, Mg, and Na + K, with 52.50% of the variance, (2) SO4, HCO3, and Mg, with 72.75% of the variance, and (3) HCO3 and Na + K, with 87.69% of the variance. Hydrochemical models developed from these results could be used to determine the chemical characteristics of groundwater at any location of interest. Multiple regression analysis could be used as a positive predictive tool for determining the chemistry of the groundwater if the dependent variable EC is measured at any location. Descriptors: *Groundwater movement, *Mathematical models, *Model studies, *Numerical analysis, *Path of pollutants, *Saline water intrusion, *Saline-freshwater interfaces, Coastal aquifers, Nested square meshes, Regional analysis.

A numerical model (NEWVAR) to simulate both the regional groundwater flow and the transient movement of a discrete interface between freshwater and saline-water or any other fluid has been developed. NEWVAR is designed to allow the analysis of a regional two-dimensional groundwater flow in coastal aquifers and permits the prediction of regional freshwater level (one-phase) and two-dimensional freshwater/saline water interface location (two-phases) using nested square meshes. The numerical solution is based on the finite difference method. After an optimal renumbering search, the Gauss-Jordan direct method or the Gauss-Siedel iterative method, through a predictor-corrector scheme, are used for solving steady-state, non-linear equations in the two-phase mode, successively for the freshwater and saline-water terms. In transient state the system of equations is simultaneously solved through semi-implicit method. Different original procedures are used to avoid difficulties generally found in such two-phase models with respect to tracking the transient position of the interface toe. The use of nested square meshes allows both a fine resolution in certain areas along with the possibility of reaching distant hydrogeological boundaries using a minimum of meshes. The numerical solution was tested against analytical ones for the cases of an advancing-retreating interface and a floating freshwater lens over saline water. These tests showed good agreement, thus verifying the finite difference approximation and the original procedures used to overlay the toe tracking dilemma. (See also W91-03311) (Author's abstract)

CASE STUDY OF INTEGRATED EXPLORATION PRACTICE FOR SHALLOW FRESH WATER AQUIFERS IN SOUTHERN PARTS OF RAMNAD DISTRICT (TECHNOLOGY MISSION PROJECT).
AFPRO GIT Unit III, Coimbatore.
J. Srinath, R. Mohommed, and K. M. Namboodiri.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 899-902, 6 fig.

Descriptors: *Aquifers, *Geophysical exploration, *Groundwater mining, *Groundwater resources, *India, Freshwater, Geophysical methods, Paleochannels, Potable water, Ramnad District, Remote sensing, Rural areas, Saline water, Vertical electrical sounding, Water supply development.

The subsurface water in the Mudukulathur block of Ramanathapuram district (Tamil Nadu, India) is mostly saline and at some places it is saltier than sea water. Pits and shallow wells dug out in the tank beds support the need for drinking water in the summer and the quality of water can change daily. A 100-sq km area was selected under the CAPART Technology Mission Project, with the aim of conducting detailed surface water and groundwater studies. Remote sensing, electrical soundings, and pH studies provided information that allowed the area to be classified into four regions for detailed field work. Vertical electrical sounding (VES) profiles were developed and shown to coincide with local geological conditions as determined by remote sensing. Hydradrill equipment was used to drill test holes, and based on the results, production wells were constructed at Kumarakkurichi, Sivalinga puram, Rajakkalpalayam, and Thothamangalamwadi to depths of 10.6, 10.8, 13.8, and 4.9 m, respectively. The four wells were fitted with India Mark II hand pumps and are yielding potable water. This study demonstrated that with remote sensing and water quality data measurements, VES traverses can be used to locate fresh water pockets. The technique was also useful in tracing paleochannels. The fresh water pocket is limited, even in the terri sand area, although it is elevated to 30 m above sea level. In such an environment, pumping schemes may have to be abandoned. Descriptors: *Geochemistry, *Groundwater chemistry, *Groundwater pollution, *Hydrogeochemical models, *Mathematical models, *Model studies, *Water chemistry, Computer programs, Kinetics, Literature review, Thermodynamics.

Hydrogeochemical modeling is important because of the socioeconomic importance of groundwater and the need to prevent its contamination with pollutants. A hydrogeochemical model is the integration of mathematical, thermodynamic, and kinetic relationships on which the geochemical calculations are based. The required calculations are facilitated by modern electronic computers. The data base required consists of the results of chemical analysis of water samples and should include all the major cationic and anionic elements and the important trace elements. Three types of calculations typically are done: (1) speciation, (2) mass balance, and (3) mass transfer and reaction path. More than 50 computer programs for hydrogeochemical models have been prepared by workers in the field. These computer models have been developed for various purposes and no single code can be used for all applications. The results from computer models can be used to establish baseline geochemical conditions for potential nuclear waste repository sites in India and to simulate the geochemical behavior of transported radionuclides. SIWANA-BARMER FRESH WATER BOWLS AS A PANORAMA OF MICRO-ALLUVIAL VALLEYS IN RASASTHAN DESERT.
National Environmental Engineering Research Inst., Nagpur (India).
P. G. Adyalkar, and V. K. Bhagdikar.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Proceedings of an International Workshop held February 28-March 4, 1989. This is Volume 2 of a 3 Volume Set. A. A. Balkema, Brookfield, Vermont. 1989. p 907-910, 8 ref.

Descriptors: *Alluvial aquifers, *Geohydrology, *Groundwater movement, *Groundwater reservoirs, *Hardness, *India, Dissolved solids, Groundwater resources, Well yield.

Micro-alluvial valleys are essentially tiny and individually minimally significant alluvial bodies strewn in the midst of the Malani group of rocks (India). Individually they rarely exceed 500 sq km and they are very limited in depth. In a recent study of Barmer district, two potential fresh water bowls were identified, one in the eastern sector covering the major part of Siwana tahsil and the other west of Barmer in an amphitheater region of Barmer tahsil. The discharge of tubewells in the Siwana bowl varies from 10 to 20 L/sec for a drawdown of 6-20 m, tapping 40-65 m of granular zones in a depth range of about 100m. The specific capacity varies from 35 to 200 L min/m of drawdown with matching high transmissivity and hydraulic conductivity. Dug wells in both the bowls are capable of yielding up to 100 cu m/day with variable phreatic surface. With an areal extent of about 2000 sq km, the static groundwater resources have been estimated at 2000 MCM, most of which remains to be tapped. The water quality in these regions is good, with total dissolved solids of 310-1080 mg/L, total hardness of 70-260 mg/L as CaCO3, chlorides of 50-220 mg/L, and sulfates of 40-120 mg/L. Descriptors: *Canal seepage, *Drainage effects, *Groundwater recharge, *Irrigation canals, *Seepage, *Surface-groundwater relations, *Water table rise, Aquifers, Hydraulic engineering, Recharge, Statistical methods.

When irrigation canals are constructed in a basin where a natural drainage system generally exists, part of the recharge due to seepage from the canals will leave the basin through the natural drainage system. If a drainage channel exists near the canals, the water table may rise over time to near the bed level of the drainage channel due to seepage from the canals. A canal-aquifer-drainage channel interaction problem was solved using a discrete kernel approach. The time of activation of a drainage channel running parallel to two continuously running ridge canals and the return flow entering the drainage channel at different times after the activation of the drainage channel were predicted. The time of activation depends on the aquifer parameters, seepage rate from the canals, distance of the drainage channel from the canals, and the elevation of the drainage channel. If a drainage channel is located nearer to the canals, it receives return flow at a higher rate. The water table between two continuously running canals takes the shape of a plateau and it is marginally affected by the presence of the drainage channel. The study led to the following conclusions: (1) a drain activates earlier for canals having larger width, other factors remaining the same; (2) if the spacing between parallel ridge canals is increased, the time for activation of a drain is delayed; (3) a drain activates at an earlier time if its distance from the parallel canals is decreased; and (4) with the presence of a drainage channel, the maximum water table height under the canal (of two parallel canals) that is closest to the drainage channel is marginally affected during a certain initial period. Journal of Irrigation and Drainage Engineering (ASCE) JIDEDH, Vol. 116, No. 5, p 645-655, September/October 1990. 4 fig, 2 tab, 8 ref.

Descriptors: *Aquifer characteristics, *Groundwater potential, *Numerical analysis, *Parametric hydrology, *Pumping tests, Confined aquifers, Graphical analysis, Leakage, Leaky aquifers, Storage coefficient, Transmissivity, Well function.

The quantitative evaluation of an aquifer depends on accurate determination of its parameters. The storage coefficient, transmissivity, and leakage factor are the useful parameters that assess the groundwater potential of a leaky aquifer. These parameters can be determined with the help of pump test data by using graphical as well as numerical methods. Graphical methods are not very reliable as these are subject to personal error of judgment. On the other hand, numerical methods avoid such errors rely on evaluation of the well function either by numerical integration or through approximation valid for small values of the arguments. Due to lack of a full-range equation for the well function, an entire set of pump test data is rarely used in analysis. A high-accuracy expression for the well function for a leaky artesian aquifer valid for an entire range of arguments has been developed, evolving a methodology for determination of cutoff error. By using this approximation well function and minimizing the sum of a criterion function based on the concept of cutoff error, aquifer parameters can be determined. (Author's abstract)

Ground Water Monitoring Review GWMRDU, Vol. 10, No. 4, p 134-143, Fall 1990. 4 fig, 1 tab, 29 ref.

Descriptors: *Aquifer characteristics, *Aquifer systems, *Geohydrology, *Groundwater movement, *Groundwater pollution, *Path of pollutants, *Water quality monitoring, Aquitards, Brunswick Formation, Geohydrologic units, Geologic fractures, Leaky aquifers, Monitoring wells, New Jersey, Shales.

Fractured shales of the Brunswick Formation provide a major aquifer in the most industrialized region of New Jersey. Numerous cases of groundwater contamination have been documented in this formation. However, the effectiveness of monitoring and remediation efforts is often hampered by the use of inappropriate concepts regarding groundwater flow controls in this complex aquifer system. One such concept presumes that near-vertical fractures parallel to the strike of beds provide principal passages for the flow and produce an anisotropic response to pumping stress. Field evidence confirms that the Brunswick Formation hosts a gently dipping, multi-unit, leaky aquifer system that consists of thin water-bearing units and thick intervening aquitards. The water-bearing units are associated with major bedding partings and/or intensely fractured seams. Layered heterogeneity of such a dipping multi-unit aquifer system produces an anisotropic flow pattern with preferential flow along the strike of beds. Within the weathered zone, the permeability of the water-bearing units can be greatly reduced. The commonly used hydrogeologic model of the Brunswick as a one-aquifer system, sometimes with vaguely defined 'shallow' and 'deep' zones, often leads to the development of inadvertent cross-flows within monitoring wells. If undetected, cross-flows may promote contaminant spread into deeper units and impair the quality of hydrogeologic data. Hydrogeologic characterization of the Brunswick shales at any given site should be aimed primarily at identification of the major water-bearing aquitard units. Recommended techniques for this characterization include fluid logging and other in-well tests. (Author's abstract)

ORIGIN OF SALINE SOILS AT BLACKSPRING RIDGE, ALBERTA, CANADA.
Alberta Research Council, Edmonton. Terrain Sciences Dept.
R. Stein, and F. W. Schwartz.
Journal of Hydrology JHYDA7, Vol. 117, No. 1/4, p 99-131, September 1990. 19 fig, 1 tab, 26 ref.

Descriptors: *Alberta, *Canada, *Geochemistry, *Geohydrology, *Saline groundwater, *Saline soils, *Saline water, *Water chemistry, Air-earth interfaces, Bedrock, Blackspring Ridge, Evaporation, Groundwater movement, Sediments, Soil types.

Problems of soil salinity occur at Blackspring Ridge, Alberta in four different settings. The most seriously affected area is at the base of the ridge where salinity appears as severe salt crusting on the surface, salt-tolerant vegetation, and areas of poor or no crop production. Blackspring Ridge is a structural bedrock high that is underlain by Upper Cretaceous sediment of the Horseshoe Canyon Formation. Bedrock is overlain by fluvial, glacial, lacustrine, and aeolian sediment. Piezometric data indicate that groundwater is recharged on and along the upper flanks of Blackspring Ridge and discharges in southern parts of a lacustrine plain that surrounds the ridge. Hydraulic conductivity data, water-level fluctuations, stable isotopes, and hydrochemical data indicate that the fractured near-surface bedrock and overlying thin-drift sediment constitute a zone of active groundwater flow within which salts are generated and transported. Water discharging from this shallow system evaporates and forms saline areas at the base of the ridge. The most seriously affected areas on the lacustrine plain coincide with places where the water table is less than 1.5 m from the ground surface. A high water table occurs locally because of the changing topology of geologic units, and lows in the topographic surface that focus groundwater and surface water flows. Some proportion of the shallow groundwater salinized by evaporation is also transported down the flow system where it mixes with unevaporated water. Surface water, from snowmelt and precipitation events, dissolves salt that was deposited at the surface by evaporating groundwater and redistributes the salt to areas of lower elevation. Descriptors: *Alluvial aquifers, *Environmental tracers, *Flow pattern, *Groundwater movement, *Groundwater recharge, *Model studies, *Recharge, *Tracers, Aquifer characteristics, Arava Valley, Infiltration, Israel, Stable isotopes, Statistical analysis, Storm seepage, Water chemistry.

A model was developed for identification and semi-quantitative evaluation of the different water bodies replenishing groundwater in the southern Arava Rift Valley. The potential sources of recharge into the alluvial aquifer of the valley were assessed by multivariate cluster analysis of environmental tracers such as dissolved ions and stable isotopes. This data was also used to determine the flow pattern to the valley, and within its alluvial aquifer, to the natural outlet of the Red Sea. Spatial variations in the chemical compositions of groundwater and their isotopic ratios are explained as the result of differential rates of replenishment of various water bodies flowing to the Arava. The alluvial aquifer of the southern Arava Valley is recharged by the following water bodies: (1) lateral subsurface flow caused by infiltration of water from flash floods occurring in the neighboring mountain massifs; (2) upward and lateral groundwater flow from sandstone and carbonate aquifers in the Negev and Edom mountains; and (3) leakage from deep-seated brine reservoirs. BOREHOLE GEOPHYSICS APPLIED TO GROUND-WATER INVESTIGATIONS.
W. S. Keys.
National Water Well Association, Dublin, Ohio. 1989. 313p.

Descriptors: *Borehole geophysics, *Data acquisition, *Geohydrology, *Geophysics, *Groundwater data, *Instrumentation, *Logging (Recording), *Measuring instruments, Groundwater resources, Quantitative analysis, Well logs.

The manual was designed to provide hydrologists, geologists, and others who have the necessary training with the basic information needed to apply the most useful borehole geophysical logging techniques to the solution of problems in groundwater hydrology. Geophysical logs can provide information on the construction of wells and on the character of the rocks and fluids penetrated by those wells and on these factors with time. The response of well logs is caused by: petrophysical factors; the quality, temperature, and pressure of interstitial fluids; and groundwater flow. Qualitative and quantitative analysis of the analog records and computer analysis of digitized logs are used to derive geohydrologic information. This information can then be extrapolated vertically within a well and laterally to other wells using logs. The physical principles by which the mechanical and electronic components of a logging system measure properties of rocks, fluids and wells, and the principles of measurement need to be understood to correctly interpret geophysical logs. Planning the logging operation involves selecting the equipment and the logs most likely to provide the needed information. Information on well construction and geohydrology are needed to guide this selection. Quality control of logs is an important responsibility of both the equipment operator and log analyst and requires both calibration and well-site standardization of equipment. Logging techniques that are widely used in groundwater hydrology or that have significant potential for application to this field include: spontaneous potential, resistance, resistivity, gamma, gamma spectrometry, gamma-gamma, neutron, acoustic velocity, acoustic televiewer, caliper, and fluid temperature, conductivity, and flow. The following topics are discussed for each of these techniques: principles and instrumentation, calibration and standardization, volume of investigation, extraneous effects, and interpretation and applications. INTRODUCTION TO MODELING OF TRANSPORT PHENOMENA IN POROUS MEDIA.
Technion - Israel Inst. of Tech., Haifa. Faculty of Civil Engineering.
J. Bear, and Y. Bachmat.
Kluwer Academic Publishers, Boston, Massachusetts. 1990. 553p.

Descriptors: *Groundwater movement, *Model studies, *Path of pollutants, *Porous media, Mass transport, Mathematical models, Porosity, Solute transport.

Practicing engineers and scientists are offered a theoretical background for the modeling of transport phenomena in porous media, applied to specific engineering problems. In principle, mathematical models of problems can be stated and solved at the microscopic level, in terms of values of variables specified at points inside each of the phases, whether fluid or solid, that occupy a porous medium domain. The main objective of the book is to present a methodology for constructing mathematical models of transport problems in a porous medium domain on the basis of the continuum approach. The book is divided into two parts: Part A, consisting of three chapters, presents the general theory of modeling transport phenomena in a porous medium domain. The first chapter presents the continuum approach, defines microscopic and macroscopic levels of description, introduces the concept of spatial averaging and defines some macroscopic characteristics of porous media and their constituents. Chapter 2 continues to develop this approach by presenting a description of transport phenomena at the microscopic level, and by deriving averaging rules for transforming the microscopic level of description of any transport problem to a macroscopic one, in which all state variables and parameters are macroscopic quantities. The various laws that govern the macroscopic fluxes of extensive quantities in a porous medium domain, are also derived. Thermodynamic concepts and quantities are introduced whenever necessary. Finally, by adding macroscopic initial and boundary conditions, a complete mathematical statement, or mathematical model, for any transport problem at the macroscopic level of description is obtained. This is discussed in Chapter 3. In Part B, the general theory presented in Part A is applied to specific problems of transport of mass and volume of a phase, mass of a component and heat in single and multiphase fluid systems in a porous medium domain. The appropriate models are developed at the macroscopic level. (Lantz-PTT)

HYDROLOGY OF LIMESTONE TERRANES: ANNOTATED BIBLIOGRAPHY OF CARBONATE ROCKS, VOLUME THREE.
International Association of Hydrologists.
J. M. Tanner, and R. ShoreDavis.
Contribution to UNESCO IHP Project A.1.13. International Contributions to Hydrogeology, Volume 2, 1986. 341p. Series editor Philip E. LaMoreaux.

Descriptors: *Bibliographies, *Carbonate rocks, *Geohydrology, *Groundwater movement, *Hydrology, *Karst hydrology, *Limestone.

Methods used to investigate the hydrological regime in carbonate terrains includes a broad spectrum of techniques from the fields of geology, geohydrology, hydrology, physics, chemistry, mathematics, and other disciplines. Some of the methods are simple; others are highly sophisticated. This annotated bibliography consists of citations listed alphabetically by principal author and numerically by document number. The annotated citations are followed by secondary author, location, and subject indexes. The Subject Index is preceded by a key to level terms used. The Location Index is by country, and secondarily by individual state. Each index lists the pertinent citations by document number. The bibliography primarily represents citations for the past decade (1975 through 1985) from the following data sources: a computer controlled search of GEOREF and GEOARCHIVE which contain publications of AGI and the Bibliography of North American Geology; Canadiana; American Book Publishing Record; Library of Congress Subject Catalog; Books in Print and Paperbound Books in Print; Bibliographic Guide to Conference Publications; Index to Scientific and Technical Proceedings; and Libros en Venta. The Calumet aquifer underlies a highly industrialized region of northwestern Indiana that contains three steel plants, one large petrochemical refinery, and many smaller manufacturing facilities. This water-table aquifer is composed of fine to medium beach and dune sands less than 65 feet thick. The water table generally is less than 8 feet below land surface. The geohydrologic characteristics of the Calumet aquifer were defined so that a network of groundwater observation wells could be properly installed for a subsequent water quality study. Maps of the water table and aquifer geometry were prepared, aquifer/stream interactions were monitored, and cross-sectional and areal finite difference digital models were constructed. The water table has broad, low-gradient mounds that generally lie between the major surface water drains. Water level records show that aquifer/stream interactions are complex and are somewhat dependent on the stage of Lake Michigan. In a 70-square-mile modeled area, the aquifer discharges about 5 to 10 cu ft/s of water to the Grand Calumet River/Indiana Harbor Canal, which subsequently drains to Lake Michigan. Less than 5 cu ft/s of water discharges directly to Lake Michigan along 20 miles of shoreline. In addition, 20 to 25 cu ft/s of groundwater discharges to leaky sewer systems. Descriptors: *Field tests, *Geophysical surveys, *Recharge, *Resistivity, *Resistivity surveys, *Soil water, *Vadose zone, Boreholes, Electrical properties, Hydraulic conductivity, Nebraska, Parametric hydrology, Particle size, Permeability, Soil types, Sounding.

From sounding measurements, the variation of electrical resistivity with depth in the soil-vadose zone can be determined. Resistivities were defined for different unsaturated sediment types by interpreting soundings made at locations in Nebraska where borehole control was available. Unsaturated sediments were found to have characteristic resistivities, with resistivity increasing with the coarseness of the soil. The soil resistivity data was combined with estimates of hydraulic conductivity to demonstrate relationships between recharge potential and resistivity. Ideally, such relationships would be based on hydraulic conductivities measured on samples taken from boreholes used for parametric soundings or better still, full-scale tests. In lieu of such measurements, estimates based on locally derived relationships using visual descriptions of grain size data can be used. For the purposes of this study, the ability to designate a range of resistivities as representing highly permeable, moderately permeable, or slowly permeable for recharge is probably appropriate and generally would be satisfactory. For efficient planning and proper management of a coastal aquifer, it is essential to predict the extent of seawater intrusion into the aquifer in response to variations in the components of the freshwater mass balance. Numerical models used to predict the location of the saltwater interface for a given set of hydrologic conditions are broadly classified into two types: diffused interface models and sharp interface models. A two-dimensional (areal) finite element model of saltwater intrusion was modified so that it can run on a microcomputer. The model assumes a sharp interface between freshwater and salt water and simulates the movement of both freshwater and salt water. Linear triangular elements are used to discretize the domain. A preprocessor is used to renumber the nodes of a given network to reduce the bandwidth of the matrix. The model was applied to the Northern Guam aquifer. The hydraulic conductivity in three regions of the aquifer was calibrated using the water level history for a few observation wells. Field measurements of the depth of the interface indicate that the sharp interface assumption is valid for most of the aquifer. Comparison of the depth of the measured 50% isochlor with the computed depth of the interface shows that the two are equal at most locations. In some cases, the computed depth is less than the measured depth which results in a conservative estimate of the interface depth. (Author's abstract)

To study the evolution of the chemical composition of water infiltrating through the unsaturated zone to groundwater, water samples were collected weekly over a 14-month period, from porous cups installed at depth intervals of 50 cm through 12 m of the unsaturated zone, at an experimental site at the University of Sao Paulo, Brazil. Previous studies furnished precipitation, hydraulic conductivity, zero-flux plane, lithologic, and geologic data (mean) at the site. The analyses of chemical composition showed that at a depth of 0.5 m, the proportion of cations was exactly the same as that found in the rainwater, i.e., rCa > rMg > rNa > rK, where r = reacting value or meq/L. During percolation of water through the unsaturated zone, the proportion changed to rNa > rK > rMg > rCa, in the groundwater at the site, to rNa > rCa > rK > Mg, and finally at a well further downs-

lope to rCa > rNa > rK > rMg. The proportion of anions in the rainwater was rSO4 > rNO3 > rCl. Immediately after rainfall infiltration, this changed to rSO4 > rCl > rNO3 > rHCO3 in the soil with the appearance of HCO3(-), which became predominant in the groundwater, i.e., rHCO3 > rCl > rSO4 > rNO3. Thus the chemical composition of water in the upper part of the unsaturated zone at the experimental site is influenced by the climate whereas that in the lower part is affected more by local lithology. Three-dimensional computer treatment of each variable showed important variations in the chemistry of water with depth in the unsaturated zone. The variations are less pronounced over time, given the more-or-less uniform conditions of a subtropical climate throughout the year. (Author's abstract)

OVERFLOW THERMAL SPRINGS OF TUSCANY (ITALY).
Consiglio Nazionale delle Ricerche, Pisa (Italy). Ist. Internazionale per le Ricerche Geotermiche.
R. Celati, S. Grassi, and C. Calore.
Journal of Hydrology JHYDA7, Vol. 118, No. 1/4, p 191-207, October 1990. 16 fig, 1 tab, 20 ref.

Descriptors: *Aquifers, *Flow models, *Geothermal water, *Groundwater movement, *Italy, *Model studies, *Thermal springs, Confined aquifers, Flow discharge, Flow pattern, Geothermal resources, Infiltration, Mathematical analysis, Outcrops, Permeability, Porous media, Spring water, Water circulation.

There are several low temperature geothermal systems spread over a large part of Tuscany, the Italian region containing high temperature geothermal fields. This region is characterized by a main thermal aquifer that is generally confined, except in some areas where the aquifer formations outcrop; most of the thermal springs of the region are located on the boundaries of these permeable outcrops. Field observations suggest a diffuse flow conceptual model for these springs as opposed to the commonly accepted models that assume water flow along faults or other isolated channels. Mathematical models assuming porous medium flow have been used to investigate some of the main characteristics of water circulation in such systems. The spring discharge can be supplied entirely by water absorbed into the adjacent permeable outcrops or by water belonging to the regional circulation, or by a mixture of the two in different proportions. Infiltration rate, surface morphology, and the resistance to water flow in the aquifer away from the permeable outcrops are factors strongly affecting the flow pattern and spring characteristics. (Author's abstract)

DRAWDOWN AROUND A WELL IN A HETEROGENEOUS, LEAKY AQUIFER SYSTEM.
Kuwait Inst. for Scientific Research, Safat.
F. Szekely.
Journal of Hydrology JHYDA7, Vol. 118, No. 1/4, p 247-256, October 1990. 4 tab, 11 ref.

Descriptors: *Aquifer systems, *Aquifer testing, *Groundwater movement, *Leaky aquifers, *Model studies, *Numerical analysis, *Well hydraulics, Aquitards, Boundary conditions, Drawdown, Error analysis, Heterogeneity, Hydraulic properties, Piezometric head.

Real, leaky multiaquifer systems are composed of several aquifers separated by aquitards. All layers have nonuniform hydraulic parameters and irregular lateral extension following natural boundaries. Wells were replaced by point sources, and storativity of aquitards was neglected. A proposed synthesized analytical-numerical (SAN) method is based on the analytical multiaquifer well flow solution, used to treat the singularity of drawdown near the well, assuming laterally homogeneous hydraulic parameters and approximate boundary conditions. The second component of the total drawdown characterizes the effect of heterogeneity of hydraulic parameters and irregular barrier boundaries via distributed sources, and may be estimated by well-conditioned numerical methods. Numerical tests prepared for a well tapping the deepest aquifer of a five-aquifer system, show high numerical accuracy (1-10 mm) far from the well and along the well casing and screen. This numerical error corresponds to the accuracy of measurements of piezometric head and in this way enables one to apply this method for parameter calibration, path line, and travel time analysis in heterogeneous aquifer systems even in the vicinity of the wells. Owing to this feature of the solution, there is no need for extreme refinement of the computational mesh near wells or well fields; in locating nodes, only spatial heterogeneity and boundary conditions should be considered. Because of the linearity of governing equations, the described single well and/or single tapped aquifer solution may be extended easily to the most general case for a well field and/or several tapped aquifers, applying the well-known method of superimposition. ESTIMATION OF THE HYDRAULIC PARAMETERS OF THE RIO-MAIOR AQUIFER IN PORTUGAL BY USING STOCHASTIC INVERSE MODELING.
California Univ., Berkeley. Dept. of Civil Engineering.
Y. Rubin, J. P. LoboFerreira, J. D. Rodrigues, and G. Dagan.
Journal of Hydrology JHYDA7, Vol. 118, No. 1/4, p 257-279, October 1990. 13 fig, 1 tab, 17 ref.

Descriptors: *Aquifer characteristics, *Flow equations, *Groundwater movement, *Model studies, *Portugal, *Stochastic models, Error analysis, Groundwater recharge, Hydraulic properties, Mapping, Mathematical models, Piezometric head, Rio Maior Aquifer, Transmissivity.

A preliminary study of a section of the Rio-Maior aquifer in Portugal was performed to identify the transmissivity and head regional distributions and the natural recharge as a function of time. A small number of transmissivity measurements on one hand and a relative abundance of head measurements (taken over a long period of time) on the other led to the casting of the identification problem in the framework of stochastic inverse modeling. The basic assumptions of the approach, are that the log-transmissivity Y is a normal and stationary random space function, the aquifer is unbounded, and a first-order approximation of the flow equation is adopted. The expected value of the piezometric head H as well as the Y unconditional autocovariance function have analytical expressions which depend on a parameter vector, all of which must be identified based on the model and by use of maximum likelihood procedures and subsequently computing the statistical moments of Y and H conditioned on the same data. This model was applied to the Rio-Maior aquifer, starting with data screening and identification of outliers among measurements, and finally drawing regional maps of the conditional Y and H with their error of estimation. Evaluation of the transmissivity distribution obtained by this method showed an improvement when compared with transmissivity distribution obtained without using the head measurements. The superficial aquifers of the Senegal sedimentary basin, like many other coastal and internal basins in Africa, have piezometric anomalies characterized by a large cone of depression, but without any significant artificial withdrawal in the area. Such depressions are often referred to as 'hollow aquifers,' and may be explained by sea level variations on the Atlantic coast of Africa, following the last glaciation. This possibility was investigated with respect to the cause of the Ferlo piezometric depression of the Senegal sedimentary basin. A multilayered digital model of the entire hydrogeologic system was used to integrate the superficial phreatic aquifer and the underlying aquifers. Simulations were begun from 18,000 BP, thus covering the period from the maximum aridity and lowest sea level to the present. The hydrodynamic behavior of the aquifers was reconstructed, particularly the present piezometry of the entire three-layer system, which is compatible with that observed today, including the depressed shape of the central zone of Ferlo. It was shown that the apparent stable conditions observed today are in fact transient conditions, but with a rate of change too small to be noticeable on a human time scale. Other causes of transient conditions in aquifers can be tectonic uplift or collapse, withdrawal of confining load such as a glacier. However, evaporation losses from deep water table aquifers cannot be ruled out in some circumstances to explain some depressed head zones in truly steady state, as in those in Central Africa. In arid zones, it appears that evapotranspiration can extract water down to several meters in the upper soil and create a discharge from the aquifer by seepage upwards in the unsaturated zone. HYDROGEOLOGICAL PROPERTIES OF THE MATRIX OF THE CHALK IN THE LUBLIN COAL BASIN (SOUTHEAST POLAND).
Academy of Mining and Metallurgy, Krakow (Poland). Inst. of Hydrogeology and Engineering Geology.
S. Borczak, J. Motyka, and A. Pulido-Bosch.
Hydrological Sciences Journal HSJODN, Vol. 35, No. 5, p 523-534, October 1990. 11 fig, 18 ref.

Descriptors: *Areal hydrogeology, *Chalk, *Geohydrology, *Poland, *Soil water, Groundwater movement, Interstitial water, Mathematical analysis, Porosity, Soil porosity, Soil properties.

The geohydrological properties of the chalk matrix were determined from laboratory studies of the cores from five boreholes and two mineshafts sunk in a sector 30 km to the east of Lublin. The

interconnected values ranged from 0.15-0.50. More than half of the samples fell between 0.25 and 0.35, the most frequent value being 0.40 in a normal distribution pattern. The interconnected porosity parameter showed a clear tendency to diminish with depth in mineshaft. The average compressed air permeability values fell within the range 0.012-50.6 mDarcy. Conversion to their water equivalent, expressed in m/s (without applying Klinkenberg's correction), yields the following extreme results: 0.898 picometer/s and 0.388 micrometer/s. The values for this parameter adjust to a fairly homogeneous lognormal distribution. There does not seem to be any tendency for this parameter to vary with depth. The specific yield is very low; only 57 samples (slightly more than 37%) were capable of yielding water under the experimental conditions, with values ranging from 0.0001 to 0.0065. The gravitational water content therefore accounts for a very slight fraction of the chalk porosity. The Lublin coal basin matrix is a very porous but only slightly permeable porous medium; its water reserves are hardly susceptible to gravity drainage. The interconnected porosity of the chalk matrix diminishes with depth, probably because of the increase in lithostatic pressure. (Hoskin-PTT)

COMPARISON OF MODELS PREDICTING GROUND WATER LEVELS ON HILLSIDE SLOPES.
Stevens Inst. of Tech., Hoboken, NJ. Dept. of Civil, Environmental and Coastal Engineering.
L. N. Reddi, I. M. Lee, and T. H. Wu.
Water Resources Bulletin WARBAQ, Vol. 26, No. 4, p 657-667, August 1990. 11 fig, 14 ref.

Descriptors: *Groundwater budget, *Groundwater level, *Hydrologic models, *Infiltration, *Mathematical models, *Model studies, *Recharge, *Slopes, *Soil water, Alaska, Comparison studies, Drainage, Evapotranspiration, Finite difference methods, Kriging, Mathematical equations, Piezometry.

A comparative study of ground water level predictions on hillside slopes is conducted. Using a simplified mass balance model that has components for evapotranspiration, recharge and drainage; and a two-dimensional finite difference model that employs kriging to estimate soil parameters and accounts for non-uniform thickness of the soil layer. These models are representative of a wide range of modeling capabilities and are used to illustrate the sensitivity of groundwater level predictions to the sophistication of the modeling techniques. The drainage and recharge components of the two models are evaluated and the importance of unsaturated flow in recharge computations is underscored. Piezometric observations in a small drainage depression on the slope of Kennel Creek Valley in Tongass National Forest, Alaska, were used to evaluate the two models. The results show that, although the predictions differ from the field observations, the simple physically-based mass balance model predicts the groundwater levels as well as the two-dimensional model. It is suggested that caution should be exercised in using complex models to validate simpler models. (Author's abstract)

Salinity problems threaten the regional economy and natural environment of the Murray Basin, an important agricultural region in Australia. Groundwater trapped within the basin can only escape by discharge to the Murray River or landscape, where salts accumulate through evapotranspiration. The basin sediments are largely water-saturated, and remaining groundwater storage capacity for increased recharge to aquifer systems is limited. Groundwater levels have therefore risen rapidly after increased infiltration from the clearing of natural vegetation for shallow-rooted plants and irrigation. The extent of characteristic assemblages of Upper Quaternary sediments and landforms shows more widespread salinization under 'natural' conditions at times in the recent geologic past. In the subsurface, a basin-wide stratigraphic framework has been established through documentation of regional distribution, geometry, and depositional environments of Tertiary units. Facies analysis of borehole data and paleogeographic reconstructions indicate at least three major depositional sequences within the Tertiary succession, each having non-marine sediments in the east and north and marine sediments in the western areas. The stratigraphy translates into a number of regional aquifer systems, confining layers, and permeability barriers to groundwater flow, each with distinctive characteristics. The development of natural groundwater discharge sites at the surface of the basin causes flow disruption and upward leakage at subsurface permeability barriers. These barriers occur where aquifer systems of the basin are significantly thinned by concealed basement features and/or by lateral changes in lithology. (Author's abstract)

Soil degradation is the most serious environmental issue facing Australia today, and a major problem is the land salinization and degradation of surface water quality in the Murray Basin of southeast Australia. An understanding of regional groundwater processes is necessary to formulate effective management plans to combat the spread of salinity throughout the basin. Groundwater flow in all four of the aquifer groups contained within the three regional groundwater provinces is toward the Murray River, which is the sole conduit for the transport of groundwater and salts out of the basin. The major impediment to flow, the mid-Tertiary low-permeability barrier, extends in a 100-km arc through the center of the basin, and disrupts lateral throughflow in the upper two aquifer groups. This disruption is one of the factors that controls the distribution of groundwater discharge zones, which are ultimately controlled by groundwater pressure in recharge zones. Land clearing in the recharge zones has increased the rainfall infiltration capacity of soils, thereby increasing water pressure, resulting in rising water tables downbasin. The total salt load in the aquifers exceeds 100,000 million tons, and, under the current groundwater-surface water interactive flow regime, <0.004% of this huge salt store is transported out of the basin. Recoverable reserves of groundwater in the unconfined aquifers total around 4.5 million ML/year. The utilization rate is only a few percent of the sustainable yield. Greater use of groundwater in recharge zones would ultimately reduce the rate of rise of the regional down-basin water table, though salt disposal considerations are the limiting factor on any development. Micropaleontological and biostratigraphic studies have been used to assist understanding the stratigraphic and structural context of groundwater flow systems in the vicinity of the Woolpunda Groundwater Interception Scheme (WGIS)--a major area of saline groundwater discharge to the River Murray in the western Murray Basin, South Australia. Structure was defined by tracing several stratigraphic markers in the Late Oligocene to Middle Miocene succession, including the Lepidocyclina foraminiferal zone and three clay or marl units of low permeability. A cross-section through the upper part of the Cenozoic sequence illustrates east-west arching, gentle Middle to Late Miocene folding, and intermittent mild Cenozoic uplift. Arching and doming across the WGIS area is confirmed by a structure contour plot on the top Renmark Group, and by limited drilling in the deeper Eocene and Cretaceous sediments. The arched structure apparently relates to draping of the Tertiary succession over a high of pre-Tertiary rocks related to the Hamley Fault. This high acts as a permeability barrier to the Renmark Group confined aquifer which thins significantly over it, promoting upward leakage into the water table aquifer, with resultant high saline discharge to the River Murray. The Woolpunda Groundwater Interception Scheme (WGIS) is being constructed along the

River Murray in South Australia, and is designed to intercept saline groundwater which is discharging into the river from the regional water table. A density contrast between river water and groundwater causes the pressure in the aquifer below the River Murray to be less than that in the aquifer adjacent to the river. The magnitude of the pressure difference is proportional to the depth of the river, and groundwater discharge is biased toward the zones of maximum pressure difference. These zones are the deepest sections of the river, herein called trenches. Groundwater entrainment from the trenches causes plumes of salinized (and hence denser) river water to flow along the bottom of the river. These plumes are fully mixed with the river water where the river is shallow. River salinity measurements and computer modeling of the density contrast effect indicate that the groundwater discharge per unit length of river is 40-60% greater at a trench than elsewhere. Saline groundwater intrusions into lowland reaches of the Wimmera River, western Victoria, Australia, accumulated under low-flow conditions to form stable 'saline pools.' An extensive area of river downstream was affected, and almost all water in the channel during flow stoppages appeared to be of groundwater origin. Saline pools which re-established within two months of flow decline had similar depth, temperature and conductivity to those found six months before. Under the prevailing intermittent flow regime, saline pools would be expected during the 7-month low-flow period in most years. Stable stratification and associated severe hypoxia rendered much of the water in the pools uninhabitable by aerobic organisms. The habitable area in many pools was confined to upper layers and shallow pool margins. Severe deoxygenation and rapid short term changes in salinity and temperature occurred with a 'first flush,' and displacement of partially mixed saline water produced secondary stratifications in deep pools downstream. Vertical conductivity gradients were associated with persistent deoxygenation at many sites as a result of this process. The total area affected by saline groundwater intrusion extended downstream far beyond the immediate area of the intrusion. This river provides a model for other rivers in the Murray-Darling Basin where saline groundwater from rising water tables drains into them. Further studies are required to develop management and control measures to prevent large-scale environmental degradation of riverine habitats in the Murray-Darling Basin. (Author's abstract)

Chlorine-36 (36-Cl) is a naturally-occurring radioactive isotope with a half-life of 301,000 +/-2000 years, and is a natural component of recharge waters into underground aquifers. Furthermore, within the aquifer environment the highly soluble chloride ion has simple geochemistry. These attributes make 36-Cl an ideal isotope for studying salt and water movement within an aquifer system. Chlorine-36 analyses of groundwater samples from 18 wells in the Victorian and South Australian Mallee region of the Murray Basin were carried out using the technique of accelerator mass spectrometry. Results of these analyses show evidence for significant recharge from rainfall over much of the study area to the underlying Murray Group limestone aquifer. Furthermore, the 36-Cl results indicate that the major source of salts to the Murray Group groundwater covered in this study, except for the discharge zones, is recent (compared with the half-life of 36-Cl) atmospheric accession. In particular, the results are not consistent with the addition of connate salts or ancient salt evaporites to the groundwater. In addition to the groundwater flow system, 36-Cl/Cl ratios have been measured for several localized discharge zones (bionkas) north of the Big Desert. The 36-Cl/Cl ratios in these samples vary by as much as a factor of 3. This variation indicates that 36-Cl has considerable potential as a tool in the study of these features. (Fish-PTT)

The origins of saline waters in Murray Basin (Australia) aquifers and elsewhere continue to be a subject of considerable debate and controversy. Core samples and groundwater from bores at Tresco, northern Victoria, in the southern margin of the Murray Basin, have been analyzed for palynology and chemistry. An aquifer immediately above the Blanchetown Clay was initially filled with fresh water that became reducing, acidic, and rich in dissolved CO2 in the early Pleistocene. Later, between 400,000 and 18,000 years B.P., the aquifer was invaded by a series of concentrated sodium chloride water pulses. These originated from brine pools below salt playa lakes on the ground surface above the aquifer. This saline invasion significantly changed the chemical evolution path of the groundwater. A marine explanation for the observed salinity patterns is not possible. (Author's abstract)

The Ivanhoe Block is a faulted and uplifted concealed basement ridge complex underlying the mallee sand dunes adjacent to the New South Wales part of the Western Riverine Plain in the central Murray Basin in southeastern Australia. The parallel basement ridges of the Ivanhoe Block deflect flow south in the deeper aquifers, and thinner beds on top of the ridges result in convergence of flow in the shallower aquifers. Groundwater salinity is strata-bound in the aquifers of the Ivanhoe Block and Western Riverine Plain. This Plain is the regional groundwater discharge zone for the eastern Murray Basin in New South Wales, and it has been created by the impeding action of the bounding Ivanhoe Block. The Western Riverine Plain is partitioned into the Balranald-Hatfield discharge zone in its western half (defining the zone of salt production and accumulation in the shallower Tertiary aquifers) and the Moulamein-Mossgiel buffer zone in its eastern half (defining the maximum historical extent of up-basin propagation of refluxed salts). In recent years the Ivanhoe Block has been the focus of growing community concern about clearing in the mallee lands and the susceptibility of these areas to land salinization. The Balranald-Hatfield discharge zone and the lower Willandra Lakes are most at risk from land salinization if water tables continue to rise. The Moulamein-Mossgiel buffer zone is in the second-highest risk category, and the eastern Riverine Plain has a low risk of salinization in its non-irrigated lands. (Author's abstract)

Dryland salinity has been gaining importance as a major environmental issue in Australia over the last 20 years. Particular focus has been given in recent times to the Murray-Darling River Basin, where loss of land productivity due to salinization is growing at a considerable rate. A dryland salinity scald approximately 48 sq km in size has been described near Yelarbon on the border of Queensland and New South Wales, near the headwaters of the Murray-Darling River Basin. The saline soils, including solodized solonetz, are severely eroded and readily identified on Landsat MSS imagery. A major fault beneath the scald has caused saline groundwater to leak up into the soil zone preferentially at this location. The evidence for this includes regional tectonic setting, detailed site geolo-

gy, a magnetic geophysical anomaly, surface drainage changes and land surface displacement, hydraulic gradient changes, and groundwater hydrochemical anomalies. Erosion of the geologically caused saline scald is being aggravated by overgrazing. An appropriate land management strategy is to fence the area and assign it nature reserve or national park status. In the Murray Basin of southeastern Australia, the accelerated emergence of groundwater-related salinity problems in recent decades has led to the realization that future viability of many of its agricultural communities depends on management of its water resources. Part of the management strategy involves understanding the stratigraphy, distribution, and geometry of units deposited in the mid-Tertiary which now form major subsurface permeability barriers. Subsurface facies analysis of borelogs and paleogeographic reconstructions indicate that the Murray Basin has been invaded by the sea on three occasions during the Cenozoic. In the mid-Oligocene, thin calcareous clay of the lower confining layer was deposited over much of the southwest of the basin, and now separates the underlying Renmark Group aquifer system from the overlying Murray Group aquifer system, but does not impede the groundwater flow from the margins of the basin to the center. As relative sea level continued to rise in the late Oligocene, the thin sediments of the lower confining layer were overlain by thicker limestones, grading laterally into thick calcareous clay (Winnambool Formation) and terrigenous clastics (Geera Clay), which combine to form the mid-Tertiary low-permeability barrier that causes major disruption to the groundwater flow towards the basin center. The Geera Clay is an important subsurface barrier, resulting in flow diversion into the overlying aquifer system. The effective porosity of the Geera Clay was found to be 0-7%, whereas the original porosity was estimated at 5-30%. Burrow interparticle porosity predominated. The occlusion of effective interparticle porosity was caused by mineral precipitation at an early stage. (Author's abstract)

DETERMINATION OF SPECIFIC STORAGE BY MEASUREMENT OF AQUIFER COMPRESSION NEAR A PUMPING WELL.
Geological Survey, Denver, CO.
S. G. Robson, and E. R. Banta.
Ground Water GRWAAP, Vol. 28, No. 6, p 868-874, November/December 1990. 7 fig, 1 tab, 18 ref.

Descriptors: *Aquifer characteristics, *Aquifer testing, *Confined aquifers, *Groundwater movement, *Pumping tests, *Storage capacity, Compression, Drawdown, Field tests, Groundwater data, Mathematical studies, Observation wells, Pump wells, Storage coefficient, Theis equation.

Aquifer tests of confined aquifers in deep formations can yield inaccurate specific storage and storage coefficient estimates if the distance between the pumped and observation wells is imprecisely known. The distance between the wells can be uncertain because small deviations in the vertical alignment of deep wells can markedly change the distance between the perforated intervals of the wells. Uncertain distance between wells may seriously degrade the accuracy of specific storage or storage coefficient values calculated from aquifer test data obtained from closely-spaced wells. A method has been proposed whereby compression of the aquifer matrix can be measured during an aquifer test and used to calculate specific storage and storage coefficient values without the knowledge of the distance between the pumped and observation wells. In a field trial of the method, specific storage and storage coefficient values calculated form aquifer compression data were 0.000000816 and 0.000304, which is nearly identical to values (0.000000804 and 0.000299) obtained from longer-term monitoring of aquifer barometric efficiency. Additional comparison with results of a Theis analysis of drawdown data indicates that the aquifer compression data may provide a more accurate determination of specific storage and storage coefficient values than would be possible even if the vertical alignment of the pumped and observation wells had been surveyed. The bedrock profile of an east-central Pennsylvania watershed contains a shallow weathered fracture layer. To begin quantifying the effects of this fracture layer on groundwater movement, two valley cross sections were chosen for detailed investigation. One section represents the typical upland watershed situation where the regional groundwater is in contact with the stream for only part of the year, while at the other section the regional groundwater is in perennial contact with the stream. Rock cores extracted from the sections reveal a pattern of extensive fracturing to approximately 50 feet directly under the stream thinning to a relatively uniform 30-ft deep fracture layer away from the channel. Limited seismic investigations support these observations. Piezometers within each cross section show that there is great variability in conductivity within the fracture layer itself. Lateral flow generally occurs within the fracture layer to within approximately 50 ft of the stream; here a converging flow pattern indicates groundwater discharge to the stream. Under wet conditions, the stream in each section serves as a point of groundwater discharge, while under dry conditions, the more upland section shows no groundwater discharge to the land surface. Rather, subsurface flow is likely occurring beneath and parallel to the channel controlled by a discharge point at some downstream location. Finally, water quality samples from the piezometers indicate a direct effect of overlying land use on water quality within the shallow fracture layer. (Author's abstract)

Hydrological investigations were conducted to determine the aquifer characteristics, recharge boundary location, and the amount of groundwater which can be withdrawn safely in order to minimize potential groundwater contamination from open pit coal mining. The impact of surface mining of coal on the groundwater system in the Singrauli Coalfield, Central India, was investigated. Field studies measured the infiltration characteristics of surface-mined land, determined surface water runoff, and analyzed the geohydrologic impacts of surface mining. Analysis of data obtained from boreholes in the study area has revealed two aquifers: an unconfined aquifer composed of medium-grained sandstone, and a confined aquifer composed of medium-to-coarse-grained sandstone. A pumping test conducted on the confined aquifer found values of transmissivity, storage coefficient, and hydraulic conductivity to be 84.14 sq m/day, 0.0004076, and 4,200 cu m/day, respectively, and a recharge boundary located at a distance of 163 m. The recharge boundary was, in fact, determined to be a north-south trending stream situated at about 200 m from the pumping well, closely corroborating the field situation with pump test data. From these studies it was concluded that water supply wells should be completed in the confined aquifer. The large-scale surface coal mining disrupts the shallow groundwater levels within 7-10 km of the cut. At deeper surface mines, water levels may be lowered as much as 70 to 100 m in the shallow aquifer. The water table level reestablishes itself when mining activity stops. This study provides the framework for three-dimensional analysis of such problems as the geohydrology, risk of potential contamination, mine flooding, highwall stability, and reclaimed land surface. DESERT ENCROACHMENT IN EGYPT'S NILE VALLEY.
Minya Univ. (Egypt). Soil Science Dept.
M. A. Kishk.
IN: Soil Erosion and Conservation. Soil Conservation Society of America, Ankeny, Iowa. 1985. p 15-23, 3 fig, 3 tab, 15 ref.

Descriptors: *Arid lands, *Desertification, *Egypt, *Nile Valley, *Soil properties, Deserts, Monitoring, Remote sensing, Soil degradation, Soil texture.

The River Nile plays an enormously important role in the life of Egypt. Studies conducted at Minia and Assiut Universities over the past 10 yr are summarized. Two hundred and seventy-six soil samples were collected at 79 sites located along lines perpendicular to the River Nile and covering an area extending from Aswan in the south to Giza in the North. Most soils located near the Nile have generally fine texture, whereas soils in the interference zone (where desert and Nile soils mix) are coarser. Alluvial soils near the river differ in several respects, as follows: darker color than interference zone soils; lower total carbonate content than interference zone soils (2.8% vs 15.2% average values); higher organic matter content (average 1.24% vs 0.23% in the interference zone; higher cation exchange capacity (32.5 meq/100 g vs 9.1 meq/100 g of soil); different mineral composition reflecting the increased amount of intermixed desert soils in the interference zone; and various other indications of desert encroachment. Desert encroachment represents a great danger to Egypt's cultivated soils and the affected areas should be mapped. A rough estimate of the affected area is 720,000 ha, which represents about one-third of Egypt's cultivated land. Three recommendations are made: (1) desert encroachment should be considered one of the most important challenges to agricultural development in Egypt; (2) measures should be implemented to prevent further mixing of desert sediments with cultivated soils; and (3) remote sensing and other techniques should be employed to monitor the changes in the extent of desert encroachment over time. EXPLORATION OF FRACTURED ZONES BY RADON DETERMINATION IN THE SOIL.
T. Pointet.
IN: Appropriate Methodologies for Development and Management of Groundwater Resources in Developing Countries. Volume III. Proceedings of an International Workshop held February 23-March 4, 1989. A. A. Balkema, Rotterdam. 1989. p 37-46, 3 fig, 1 tab, 6 ref.

Descriptors: *Borehole geophysics, *Developing countries, *Environmental tracers, *Geologic fractures, *Radon radioisotopes, *Tracers, *Water resources development, Africa, Burkina Faso, Geohydrology, Geophysical methods, Groundwater management, Groundwater mining, Groundwater movement, Groundwater potential, Soil gases, Water demand, Water resources management, Water yield improvement.

The exploration of aquifer environments in basement rocks, like most aspects of hydrogeology of fractured environments, is marked by their discontinuous character. The statistical study of yields obtained from several tens of thousands of boreholes in African crystalline rocks shows that 15% of them produce more than 5 cu m/ hour. The usual geological analysis however does not determine why one borehole has a small or a high yield. By these methods alone, it is impossible to propose siting rules which would significantly increase the possibility of obtaining large yields. The water demand is presently increasing. The predictable development of irrigated farming and potable water supply of small towns from groundwater supposes that one will be able to find high individual yields in the basement zones with high enough success rates to justify research costs. By turning towards less traditional techniques inspired by structural geology and the study of fracture networks, it has been observed that the radon contained in the soil gases act as an efficient natural tracer, by underlining the presence of permeable zones in a fractured massif. Systematic prospecting by radon dosing in the soil gases brings out locally-concentrated anomalies. The boreholes drilled immediately below these anomalies are usually very productive. Applied to prospecting, the method was tested in Burkina-Faso along with electric and electromagnetic geophysical methods, and with siting techniques based on structural analysis. In environments of crystalline and metamorphic rocks, the water yields obtained from boreholes sited on radon anomalies are distinctly higher than those from boreholes sited by other methods. MEASURING THE HYDRAULIC PROPERTIES OF A STABLE AGGREGATED SOIL.
Commonwealth Scientific and Industrial Research Organization, Glen Osmond (Australia). Div. of Soils.
K. R. J. Smettem, and C. Kirkby.
Journal of Hydrology JHYDA7, Vol. 117, No. 1/4, p 1-13, September 1990. 5 fig, 3 tab, 24 ref.

Descriptors: *Hydraulic conductivity, *Hydraulic properties, *Soil aggregates, *Soil properties, *Soil water, Diffusivity, Flow models, Mathematical analysis, Permeability, Sorptivity.

Reliable modeling of soil-water flow requires accurate and convenient measurement of the appropriate soil hydraulic properties, which can be particularly problematic in structured soils with a distinct macropore-matrix dichotomy in the flow regime. The hydraulic properties of an aggregated soil at water supply potentials near saturation were obtained using the disc permeameter. The sorptivity, the hydraulic conductivity, and the wetting soil-water characteristic were measured directly. The soil-water diffusivity was derived from measurements of hydraulic conductivity and wetting soil-water characteristic and was also shown to be well described by deconvoluting the sorptivity using the Parlange approximation. This description of soil-water diffusivity conveniently supplements es-

timates obtained over a wider range of water contents using the absorption method of Bruce and Klute, with water content profiles obtained by gamma scanning. Finally, the measured hydraulic conductivity function was accurately described by introduction of a method for scaling the wetting soil-water characteristic over the inter-aggregate and intra-aggregate flow regions and matching to the measured hydraulic conductivity at two points. AIR PERMEABILITY MEASUREMENTS OF THE UNSATURATED BANDELIER TUFF NEAR LOS ALAMOS, NEW MEXICO.
Oak Ridge National Lab., TN.
P. M. Kearl, R. J. Zinkl, J. J. Dexter, and T. Cronk.
Journal of Hydrology JHYDA7, Vol. 117, No. 1/4, p 225-240, September 1990. 4 fig, 2 tab, 21 ref.

Descriptors: *Aeration zone, *Bandelier Tuff, *New Mexico, *Path of pollutants, *Permeability, *Radioactive waste disposal, *Soil water, *Tuff, *Unsaturated flow, Air permeability, Analytical methods, Geologic formations, Los Alamos, Measuring instruments, On-site investigations, Porous media.

The Bandelier Tuff near Los Alamos, New Mexico, is located approximately 200 m above the regional water table. Because of the distance to the water table, organic and radioactive wastes were disposed of in unlined trenches and shafts within the tuff. Concerns regarding the movement of the contaminants, particularly in the vapor phase, prompted a site investigation. Part of that investigation included the determination of the permeability of the tuff. Three methods which measure the intrinsic permeability were used: air injection, vacuum testing, and laboratory testing of rock core samples. Dual packers were used to isolate specific zones for the air injection and vacuum tests. Klinkenburg and dynamic methods were used to measure permeabilities in the laboratory. Comparison of the results showed that vacuum tests produce results which are in good agreement with the laboratory permeabilities for unfractured zones. Permeabilities measured with air injection tended to be as much as an order of magnitude higher than those measured by the other methods. For estimates of the intrinsic permeability in the unsaturated zone, however, both air injection and vacuum tests are reliable methods. Because consolidated core samples are required for laboratory testing, it was concluded that field test results are the more reliable indicators of bulk permeabilities. (Author's abstract)

Descriptors: *Artificial recharge, *Electrical properties, *Hydraulic properties, *Sand, *Soil water, *Unsaturated flow, *Vadose zone, Aeration zone, Groundwater recharge, Hydraulic conductivity, Moisture equivalent, Permeability, Resistivity, Saturated soils.

Relations between the electrical properties of unsaturated vadose zone sediments and their saturated hydraulic conductivity provide a basis for using surface electrical measurements to estimate the potential for artificially recharging groundwater at a site. Laboratory measurements of moisture equivalent (specific retention), saturated permeability, hydraulic conductivity, and electrical resistivity were made on a series of uniform, very fine or medium grain size Ottawa sands. For these sediments, the unsaturated form of Archie's law was shown to be adequate. The experimental results were combined and interpreted to demonstrate a relationship between the apparent formation factor and/or resistivity at the moisture equivalent and saturated hydraulic conductivity for the same sediment. These laboratory results provide a limited experimental basis for relationships between the resistivity of vadose zone sediments and their saturated hydraulic conductivity. (Author's abstract)

HYDROLOGY, AQUATIC MACROPHYTES, AND WATER QUALITY OF BLACK EARTH CREEK AND ITS TRIBUTARIES, DANE COUNTY, WISCONSIN, 1985-86.
Geological Survey, Madison, WI. Water Resources Div.
S. J. Field, and D. J. Graczyk.
Available from Books and Open File Report Section, USGS, Box 25425, Denver, CO 80225. USGS Water-Resources Investigations Report 89-4089, 1990. 38p, 22 fig, 13 tab, 49 ref.

Descriptors: *Aquatic plants, *Black Earth Creek, *Trout, *Water quality, *Wisconsin, Biomass, Dissolved oxygen, Nitrogen, Phosphorus, Sediment yield, Stream discharge, Water temperature.

An intensive monitoring program of Black Earth Creek and its tributaries, in southern Wisconsin was conducted from October 1983 through September 1986, to define aquatic macrophytes, water quality, and the hydrologic factors that affect trout populations. Streamflows for water years 1985 and 1986 were 44 and 60% greater than the long-term average (1955-86). The highest average annual discharge since 1954, 53.4 cu ft/sec, was recorded in water year 1986. The data indicate that trout populations may be related to average annual streamflow because of greater water volumes and colder water temperature. Summer storm runoff resulted in decreased dissolved-oxygen content in two streams studied. During one storm, dissolved oxygen in Black Earth Creek decreased 3.0 mg/L and was less than 6.0 mg/L (the minimum State standard for trout) for 30 hours. Aquatic macrophyte biomass in Black Earth Creek was substantially less in 1986 than in 1985 because of substrate scouring from a flood in July 1985. Discharge from point and nonpoint sources affects Black Earth Creek's water quality. Warm water discharged from a gravel pit increased water temperatures from 2 C to 4 C. Detention ponds in the Brewery Creek basin appear to effectively control suspended-sediment and phosphorus runoff during periods of moderate runoff; this basin had the highest concentration of suspended sediment and total phosphorus but did not have the highest yields of the basins studied. Suspended-sediment yields in water year 1985 were 29% greater than the 12-year-average yields (1955-65, 1985). (USGS)

IN: Water: Laws and Management. American Water Resources Association, Bethesda, Maryland, 1989. p 6A-25--6A-34, 2 fig, 5 tab, 7 ref.

Descriptors: *Aerial photography, *Lake George, *Land use, *New York, *Urbanization, *Water

management, *Wetlands, Data interpretation, Drainage effects, Habitats, History.

The Warren County shoreline of Lake George, New York, was investigated for wetland loss and resultant land use change using historical aerial photography (1946-1986). Approximately one-half of the wetlands in the study area had received some impact from development since 1948, with a total wetland habitat loss of 58.2 ha (143.6 acre) or 27.2% of the original wetland area. The bulk of the wetland loss was from filling for urban and residential development. Most wetland alterations occurred prior to 1978. The enactment of two major wetland protection measures by the State of New York has apparently eliminated serious wetland loss in spite of increasing developmental pressures in the Lake George region. Descriptors: *Flow profiles, *Hydrologic models, *Model studies, *Simulation analysis, *Wetlands, Data interpretation, Drought, Flood flow, Florida, Hydrologic profiles, Infiltration.

Wetlands are ecological systems with unique hydrologic characteristics. Flat terrain, high water tables, and dense vegetation comprise a physical system which is prone to frequent inundation. Due to their ecological value, wetlands have attracted the interest of the public, and subsequently that of the scientific community. An in-depth research regarding wetlands requires the integration of different disciplines such as ecology, forestry, soil chemistry, biology, hydrology, hydraulics, economics and resource management. However, the basis for efficient management of a wetland system depends on a good understanding of the water balance and water dynamics of the system. This can be achieved by mathematically modeling the water movement. Special features of the system that effect its hydrodynamics are high bed friction and surface groundwater interactions. A numerical model for simulating wetland flow dynamics was developed, with the governing equations those for a one-dimensional, depth integrated system. The model can simulate the flooding and drying of wetlands, and the effects of groundwater infiltration. It has the capability to incorporate the effects of infiltration, evapotranspiration, precipitation, lateral inflows, and variable topography. The model was calibrated and tested for an experimental marsh area in southern Florida, and simulated results showed satisfactory agreement with field data. (See also W91-03032) (Lantz-PTT)

FISHERY FUNCTIONS AND VALUES OF FORESTED RIPARIAN WETLANDS.
Auburn Univ., AL. Dept. of Fisheries and Allied Aquacultures.
J. H. Crance, and L. S. Ischinger.
IN: Water: Laws and Management. American Water Resources Association, Bethesda, Maryland, 1989. p 14A-9--14A-16, 1 fig, 43 ref.

Descriptors: *Ecosystems, *Fisheries, *Forest watersheds, *Riparian waters, *River fisheries, *Wetlands, Flood plains, Productivity, Species diversity, Water resources development.

Relationships between freshwater forested flood plain wetlands in the southeastern US and the associated riverine fishery resources are reviewed, and management implications and research needs are discussed in this paper. Forested riparian wetlands provide spawning and nursery habitats for more than 90 species of fish, and the annual fishery harvest from some of the most productive wetlands has exceeded 8,000 kg/sq km. These wetlands also import, store, produce, and recycle materials used in food chains in situ, and are a source of residual materials used in downstream food chains. Wetland characteristics that respond to hydrologic regimes include productivity, species diversity and structure, nutrient cycling, and fish habitat quality and quantity. Thus, anthropogenic changes that affect hydrologic regimes and the fishery resources of these wetlands should be considered when stream corridor developments are evaluated. SUWANNEE RIVER ESTUARY: AN OVERVIEW AND RESEARCH AND MANAGEMENT NEEDS.
Suwannee River Water Management District, Live Oak, FL.
R. A. Mattson, and M. E. Rowan.
IN: Water: Laws and Management. American Water Resources Association, Bethesda, Maryland, 1989. p 14B-17--14B-31, 3 fig, 2 tab, 13 ref.

Descriptors: *Estuaries, *Florida, *Management planning, *Research priorities, *Suwannee River Estuary, Vegetation, Water quality, Water resources development, Water resources management.

The Suwannee River is the second largest river in Florida in terms of discharge and its estuary is one of the least disturbed by man's activities in the State. The estuary is also one of the least studied, yet it is one of the largest estuarine systems on the Gulf Coast of Florida and is the largest single estuary on the Florida Big Bend coast. Surface area at mean high water has been reported to be 14,336 ha; but the actual area of the estuary is difficult to determine, as it is not a semi-enclosed bay. The estuary was characterized based on existing data and studies, with respect to temperature, salinity, conductivity, pH, turbidity, dissolved oxygen, alkalinity, orthophosphate, nitrates, ammonia, chlorophyll a, fish and wildlife resources, and vegetation. Research and management needs for the estuary were identified in order to develop an effective management plan supported by competent data, and emphasize water quality protection, minimum standards, habitat preservation, and basin resource planning issues. CREATION, RESTORATION, AND ENHANCEMENT OF MARSHES OF THE NORTHCENTRAL GULF COAST.
Louisiana State Univ., Baton Rouge. School of Forestry, Wildlife and Fisheries.
R. H. Chabreck.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Covelo, California. 1990. p 125-142, 2 tab, 44 ref, 2 append.

Descriptors: *Artificial wetlands, *Coastal marshes, *Louisiana, *Water resources management, *Wetland restoration, *Wetlands, Alabama, Diversion, Drainage engineering, Dredging, Environmental engineering, Levees, Marsh management, Mississippi, Planting management, Salt marshes, Sedimentation, Texas, Tidal marshes, Vegetation establishment, Water resources development, Weirs.

Coastal marshes of the northcentral Gulf Coast comprise almost 50% of the coastal marshes of the United States, excluding Alaska. Over 80% of the marshes in this region occur in Louisiana because of the influence of the Mississippi River. Salt, brackish, intermediate, and fresh marshes are well-represented within the region. Marshes have been created from dredged material deposited in shallow waters and by controlled diversion of river flow to direct sedimentation to specific sites. Plantings are seldom made on dredged material in Louisiana because of the large area to be planted and the fact that natural colonization is rapid. In fresher marshes, dredged material is left as levees after canals are dug that connect to salt water sources. Levees reduce salt water contamination and drainage of the marsh. Dredge material is usually planted in Texas, Mississippi, and Alabama to stabilize the material and hasten marsh development. In tidal marshes, construction of weirs is the most widely used enhancement practice. Impoundments provide a mechanism for controlling water depth and salinity and regulating plant growth. But impoundments can only be constructed in marshes that will support a continuous levee system. Freshwater diversion from the Mississippi River has been used on a small scale for marsh restoration and enhancement but could be used to improve vast areas of the rapidly deteriorating marshes of southeastern Louisiana. Precise information is needed on subsidence rates of individual localities for planning marsh creation and restoration projects. Methods for maximizing subdelta development and determining best use of dredged material are needed. (See also W91-03244) (Author's abstract)

CREATION AND RESTORATION OF FORESTED WETLAND VEGETATION IN THE SOUTHEASTERN UNITED STATES.
A. F. Clewell, and R. Lea.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Covelo, California. 1990. p 195-231, 6 fig, 98 ref, 3 append.

Descriptors: *Artificial wetlands, *Forest ecosystems, *Swamps, *Vegetation establishment, *Water resources management, *Wetland restoration, *Wetlands, Hardwood, Oak trees, Plant populations, Planting management, Soil-water-plant relationships, Trees, Vegetation regrowth, Water resources development.

A wide variety of forest establishment techniques have been employed, some with initial success, but most are too new for critical evaluation. Most of these projects pertain to bottomland hardwood and cypress replacement. The two most significant trends in project activity have been the direct seeding of oaks on abandoned croplands and the replacement of all trees and sometimes the undergrowth at reclaimed surface mines. Project success depends largely on judicious planning and careful execution. The most critical factor for all projects is to achieve adequate hydrological conditions. Other important factors may include substrate stability, availability of adequate soil rooting volume and fertility, and the control of herbivores and competitive weeds. Success criteria for evaluating extant projects throughout the southeast need to place emphasis on the presence of preferred species and on the attainment of a threshold density of trees that are at least two meters tall. At that point, release from regulatory liability should be seriously considered. Several critical information gaps have been identified: (1) the sylvicultural literature warrants further investigation of wetland tree establishment; (2) the conditions conducive to effective natural regeneration need to be elucidated; (3) techniques for undergrowth establishment should be developed; (4) baseline ecological and floristic studies need expansion for certain plant communities and regions; (5) research is needed to deter-

mine if successful forest replacement will provide the functional services of the original ecosystem; and (6) the time is ripe for a coordinated southeastern regional monitoring effort. (See also W91-03244) (Author's abstract)
W91-03252

FRESHWATER MARSH CREATION AND RESTORATION IN THE SOUTHEAST.
Erwin (Kevin L.) Consulting Ecologist, Inc., Fort Myers, FL.
K. L. Erwin.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Covelo, California. 1990. p 233-265, 16 fig, 2 tab, 43 ref, append.

Descriptors: *Artificial wetlands, *Habitat restoration, *Marsh management, *Water resources management, *Wetland restoration, *Wetlands, Environmental impact, Monitoring, Planting management, Research priorities, Vegetation establishment, Water quality control, Water resources development.

Freshwater marsh habitat has been created or restored in the southeast to mitigate the environmental impacts associated with development activity and to provide enhancement of water quality. Key elements to successfully constructing a freshwater marsh system include: realistic goals and measurable success criteria; proper pre-construction design evaluation including a hydrological analysis; contour design; construction technique; proper water quality; compatibility of adjacent existing and future land uses; appropriate substrate characteristics; revegetation techniques; reintroduction of fauna; upland buffers and protective structures; supervision by an experienced professional; post-construction long-term management plan; and monitoring and reporting criteria. The monitoring required must be adequate in scope to determine the success or failure to meet project goals. A typical monitoring plan for a created freshwater marsh should include: (1) a post-construction, pre-planting survey of project contours and elevations; (2) ground and surface water elevation data collection; (3) water quality data collection; (4) biological monitoring including, but not limited to, fish and macroinvertebrate data collection; (5) evaluation of vegetation species diversity, percent cover, and frequency; and (6) wildlife utilization. Critical information gaps and research needs fall into the categories of site selection and design, project construction techniques, comparative studies of the biological communities and processes in created and natural systems, and the role of uplands and transitional habitats. (See also W91-03244) (Author's abstract)
W91-03253

RESTORATION AND CREATION OF PALUSTRINE WETLANDS ASSOCIATED WITH RIVERINE SYSTEMS OF THE GLACIATED NORTHEAST.
D. J. Lowry.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Covelo, California. 1990. p 267-280, 1 fig, 1 tab, 32 ref, append.

Descriptors: *Artificial wetlands, *Glaciation, *Habitat restoration, *Water resources management, *Wetland restoration, *Wetlands, Environmental policy, Environmental quality, Monitoring, Research priorities, Water resources development.

Published information on freshwater wetland creation in the glaciated northeastern United States is largely limited. Though there is more experience in constructing wetlands than the literature base would indicate, there has been no compilation of the experience obtained from most of the wetland creation projects in the region and there appears to be a general lack of detailed monitoring which would provide data necessary for assessment of results. Long-term, comprehensive studies evaluating the functions of created freshwater wetlands in the region are not presently being conducted. There is, therefore, a need to document the ability of such areas to provide a range of ecological and hydrological functions, rather than just serving as sites where wetland plants grow and that waterfowl visit. In evaluating future projects involving wetland creation as mitigation for wetland loss in the region, the following critical points should be emphasized: (1) the project proposal should provide an assessment of the wetland functions; (2) goals should be developed based on the most significant functions; (3) the hydrologic setting and water budget of the created area must be understood; (4) present capabilities to create other wetland types (swamps, fens, bogs) is in question; (5) every attempt should be made to replace lost wetland in the same hydrogeologic unit and reach of the riverine system associated with the original wetland; (6) an understanding of the area where the wetland is proposed to be created is needed; (7) detailed consideration of a number of logistical constraints (hydrologic controls, machinery needs, availability of plant stock and soils, sediment and erosion control, wildlife predation, and barriers to human intrusion) is always necessary; and (8) monitoring requirements should depend on the functions determined to be of most significance at the assessment stage. (See also W91-03244) (Fish-PTT)

REGIONAL ANALYSIS OF THE CREATION AND RESTORATION OF KETTLE AND POTHOLE WETLANDS.
G. G. Hollands.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Coveio, California. 1990. p 281-298, 40 ref, append.

Descriptors: *Artificial wetlands, *Environmental engineering, *Glaciation, *Hydrologic budget, *Water resources management, *Wetlands, Continental basins, Permeability, Potholes, Soil properties, Streams, Surface-groundwater relations, Water resources development, Watershed management.

Kettles are topographic basins created by a variety of glacial processes and occur randomly throughout glaciated regions. They are associated with both permeable and impermeable deposits. Kettle wetlands can have complex hydrologic types: those having no inlet or outlet streams, and those associated with surface water streams. Complex relationships of surface water, groundwater, water chemistry, and other hydrologic elements combine to create water balances. This has been documented in the Prairie Potholes region of the United States where site specific hydrologic research has been conducted. Creating kettle wetlands is similar to other types of freshwater wetland creation, except where unique vegetation and hydrology are involved and replication may be a complex, technical effort. Identification of limiting factors is critical to wetland creation. Typical factors important to kettle wetlands are: surface water hydrology, groundwater hydrology, stratigraphy, soils, and water chemistry. Depending upon the goals of the project, other limiting factors may include: nuisance animals, long-term maintenance/monitoring, lack of funds, and disposals of excavated soil. The primary concern in creating kettle wetlands is the establishment of the proper hydrology. This normally requires mid-course corrections in design during construction to establish proper post-construction hydrology. Critical needs include studies on microstratigraphy, geochemical processes, the properties of organic soil, and the details of hydrology. (See also W91-03244) (Author's abstract)

REGIONAL ANALYSIS OF FRINGE WETLANDS IN THE MIDWEST: CREATION AND RESTORATION.
Indiana Univ. at Bloomington. School of Public and Environmental Affairs.
D. A. Levine, and D. E. Willard.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Covelo, California. 1990. p 299-325, 4 tab, 85 ref, 2 append.

Descriptors: *Artificial wetlands, *Lake shores, *Reservoirs, *Water resources management, *Wetland restoration, *Wetlands, Monitoring, Plant populations, Planting management, Shoreline cover, Vegetation establishment, Water level fluctuations, Water resources development.

'Fringe' wetlands are those found along lakes and reservoirs, abundant in the midwest United States. Very few documented cases of fringe wetland mitigation are found. Their prevalence in this region suggests that Midwestern administrators of the regulatory program will be confronted with permits which impact fringe wetlands. Specific goals must be clearly outlined in the mitigation permit and include the following: detailed construction plans; a list of target species consistent with project goals; a long-term management plan; and a complete monitoring plan. To further ensure the success of mitigation, the following is recommended: the establishment of a fringe wetland should not be attempted where the fetch is greater than 13 km unless a dike is constructed to reduce wave action; and revegetation should utilize a combination of both natural (i.e., seed bank) and artificial (i.e., transplants) methods. Further research is needed (1) to determine how fringe wetland plant species and plant communities as a whole influence water quality, (2) to determine how water level fluctuations affect species composition and nutrient cycling in these wetlands, (3) to quantify shoreline stabilization needs and functions, and (4) to develop ecotypically-adapted planting stocks. CREATION AND RESTORATION OF RIPARIAN WETLANDS IN THE AGRICULTURAL MIDWEST.
Indiana Univ. at Bloomington. School of Public and Environmental Affairs.
D. E. Willard, V. M. Finn, D. A. Levine, and J. E. Klarquist.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Covelo, California. 1990. p 327-350, 1 fig, 1 tab, 35 ref, 2 append.

Descriptors: *Artificial wetlands, *Habitat restoration, *Riparian land, *Water resources management, *Wetland restoration, *Wetlands, Hydrologic budget, Planting management, Riparian vegetation, Riparian waters, Vegetation regrowth, Water resources development.

Effective restoration of riparian wetlands in the agricultural midwest region of the United States demands an early determination of project goals. There are no systematic records of the changes and developments that have occurred in and around several hundred large midwestern reservoirs with extensive wetland systems. Established goals will narrow the choices of potential project sites, which can then be evaluated based on hydrology, substrate, seedbank viability, and water quality. Creation and restoration plans should include a realistic timetable that accounts for construction and hydrology constraints, including specifications for revegetation species. Finally, plans should estimate long-term vegetation management requirements and establish monitoring schedules to assess project success. (See also W91-03244) (Fish-PTT)

CREATION AND RESTORATION OF RIPARIAN HABITAT IN SOUTHWESTERN ARID AND SEMI-ARID REGIONS.
SWCA, Inc., Tucson, AZ.
S. W. Carothers, G. S. Mills, and R. R. Johnson.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Covelo, California. 1990. p 351-366, 1 tab, 26 ref, 2 append.

Descriptors: *Artificial wetlands, *Habitat restoration, *Riparian land, *Water resources management, *Wetland restoration, *Wetlands, Arid lands, Planting management, Research priorities, Riparian vegetation, Riparian waters, Soil-water-plant relationships, Vegetation establishment, Water resources development.

Though the literature on characteristics, values, and functions of riparian habitats in the arid and semiarid southwestern region of the United States is fairly extensive, few papers that pertain to its creation or restoration are available. Because these projects are so recent, evaluations of successes and

failures are based on short-term results; long-term survival and growth rates are as yet unknown. In most cases, creation and restoration projects have involved the planting of vegetation and not the creation of conditions suitable for the natural regeneration of riparian habitats. Important considerations for riparian creation or restoration projects in the Southwest include: depth to water table; soil salinity and texture; amount and frequency of irrigation; effects of rising and dropping water tables on planted trees; protection from vandalism, off-road vehicles, and livestock; monitoring of growth rates as well as survival; and project design flexible enough to allow for major modifications. Because the creation and restoration of riparian habitats in the Southwest is new and mostly experimental, more information is needed for virtually every aspect of revegetation. Two major questions that need to be answered are whether planted trees survive for more than a few years and reach expected sizes, and what ranges of planting parameters are most cost-effective. Specific information needs include the identification of: the most suitable watering regimes; suitable soil conditions for various tree species; long-term survival and growth rates; and effects of variable water levels on planted trees. OVERVIEW AND FUTURE DIRECTIONS.
San Diego State Univ., CA. Pacific Estuarine Research Lab.
J. B. Zedler, and M. W. Weller.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Covelo, California. 1990. p 405-413, 1 fig, 1 ref.

Descriptors: *Artificial wetlands, *Habitat restoration, *Research priorities, *Water resources management, *Wetland restoration, *Wetlands, Decision making, Economic aspects, Environmental policy, Interagency cooperation, Water resources development.

Despite loss of over 50% of the wetlands in the contiguous United States, there is continuing pressure to use wetlands for immediate economic gain. Functional values that are nearly perpetual are rarely considered, and the complexity, integrity, and uniqueness of natural wetlands are undervalued. The greatest information and research strategies needed are: to improve wetland restoration/creation efforts, to determine the degree to which constructed systems can replace lost functions, and to determine the potential for persistence of restored and constructed wetlands. There is a national need to understand wetland functioning at its most basic and detailed levels, to compare natural and constructed wetlands within biogeographic regions, and to test methods of restoring wetlands using manipulative experimentation. Wetland research should be directed toward the proximate goal of preserving wetland values, and ultimately, of understanding the details of how wetlands function. Problems and objectives involve different research levels (e.g., size of areas, time scales, precision, and complexity). Some problems require immediate solutions for crisis situations; with answers based on research that uses a less precise level or a smaller size scale. The research program must build short-term goals into a long-term design, both to gain perspective and to prioritize projects and funding. Interaction between researchers and regulatory personnel will help solve practical problems and crisis decision-making and help develop technology for restoring degraded wetlands or constructing new ones. WETLANDS RESTORATION/CREATION/ENHANCEMENT TERMINOLOGY: SUGGESTIONS FOR STANDARDIZATION.
Lewis Environmental Service, Inc., Tampa, FL.
R. R. Lewis.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Covelo, California. 1990. p 417-422, 12 ref.

Descriptors: *Artificial wetlands, *Publications, *Standards, *Water resources management, *Wetland restoration, *Wetlands, Environmental policy, Glossaries, Habitat restoration, Literature review, Water resources development.

A glossary has been prepared which attempts to bring some order to the terminology applied to the topic of wetland creation and restoration. Six glossaries applicable to the topic were reviewed and combined, with additional definitions from individual authors of published papers or proceedings, and regulatory or review agency rule promulgation. The five key definitions are: mitigation, restoration, creation, enhancement, and success. These terms are defined so that there is as little ambiguity and overlap as possible. A glossary definition and an explanation of each of the key terms is provided. (See also W91-03244) (Fish-PTT)

RESTORATION OF THE PULSE CONTROL FUNCTION OF WETLANDS AND ITS RELATIONSHIP TO WATER QUALITY OBJECTIVES.
Butler Univ., Indianapolis, IN. Holcomb Research Inst.
O. L. Loucks.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Covelo, California. 1990. p 467-477, 4 fig, 3 tab, 19 ref.

Descriptors: *Hydrologic budget, *Rainfall-runoff relationships, *Water resources management, *Watershed management, *Wetland restoration, *Wetlands, Bed load, Headwaters, Hydrologic models, Land use, Model studies, Stream discharge, Streams, Water resources development.

Many wetlands and wetland restoration opportunities occur in the poorly drained headwaters of streams, along the stream floodplains, and at discharge points to larger water bodies. All of these are greatly changed by upland development that accelerates flows and increases the runoff pulse from headwater areas. Successful restoration must consider how the hydrologic pulse may have been changed and whether pulse control measures can bring stream flows within a range consistent with historical development of downstream wetlands. Comparison of spring versus summer loadings pulses indicates major differences in the seasonality of transport of excess nutrients into wetlands and downstream water bodies. The annual average loading is misleading, indicating that statements on wetland functions which ignore their role during pulsed events probably understate their significance. Modeling studies of runoff and sediment transport suggest the combination of reduced soil exposures and restoration of wetland cover in temporary detention areas can produce major benefits in stream water quality. With additional parameters, quantitative estimates could be made of the cumulative impact of wetland restoration toward mitigation of flood peaks and the transport of sediment and toxic substances into the adjacent aquatic systems. The general physical relationships between land use and hydrology provide only a guide to the prospective benefits associated with investment in wetland restoration. There is a need for more complete treatment-response modeling and model testing if the predictive capability needed to improve wetland restoration is to become available. LONG-TERM EVALUATION OF WETLAND CREATION PROJECTS.
Hampshire Coll., Amherst, MA. School of Natural Science.
C. D'Avanzo.
IN: Wetland Creation and Restoration: The Status of the Science. Island Press, Covelo, California. 1990. p 487-496, 42 ref.

Descriptors: *Artificial wetlands, *Long-term planning, *Management planning, *Performance evaluation, *Water resources management, *Wetland restoration, *Wetlands, Environmental engineering, Evaluation, Habitat restoration, Soil properties, Succession, Vegetation establishment, Water resources development.

The long-term evaluation of artificial wetlands is very difficult because wetlands are created for a variety of purposes. Little is known about basic aspects of many wetland systems, 'succession' in wetlands is less straightforward than previously assumed, and it is difficult to generalize from one wetland type to another. There is a striking range of opinions about the success of wetlands that have been created. On the one hand, the U.S. Army Corps of Engineers' dredged material stabilization program exemplifies artificial wetland projects that appear successful over a decade or more. Several types of criteria including vegetation characteristics, soil chemistry, and animal studies suggest that several dredged material wetlands are becoming similar to reference wetlands with time. But some wetlands characteristics (soil carbon) may require many years to reach natural levels. In contrast, a great many other artificial wetland projects are problematic or failures, because of improper hydrology, erosion, herbivory, and invasion by upland plants. Many projects have never been evaluated so their permanence is not known. In evaluating projects with regard to persistence of the created wetlands, the following points are especially important: (1) evaluations over at least 10-20 years are desirable; (2) vegetation characteristics are useful but do not necessarily indicate function; (3) chemical/physical aspects of wetland soils are also useful in evaluating trends; (4) local reference wetlands are critical for comparative purposes; and (5) some wetlands should be created with great caution because they have failed in the past or because very little is known about these wetland types. PHOTOHETEROTROPHY AND DARK HETEROTROPHY IN ICE-COVERED LAKE ST. CLAIR.
Windsor Univ. (Ontario). Great Lakes Inst.
D. G. Wallen.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 3, p 339-345, 1990. 3 fig, 1 tab, 46 ref.

Descriptors: *Carbon, *Glucose, *Great Lakes, *Ice cover, *Iced lakes, *Lake St Clair, *Lakes, *Limnology, *Photosynthesis, *Phytoplankton, Aphotic zone, Euphotic zone, Light intensity, Primary productivity.

Both light and dark uptake of glucose carbon by the microplankton in ice-covered Lake St. Clair were measured several times over the winter period, from December to March. Heterotrophic potentials (Vmax) were consistently and significantly higher in the light (ranging from 3.9-10.7 nanomoles glucose/L/hr) than in the dark (2.5-5.2 nM glucose/L/hr). Respiratory release of glucose carbon ranged from 0.27 to 2.28 times higher in the dark than light. Vertical profiles of photosynthesis and heterotrophy on 21 January and 20 February indicated that photoheterotrophic carbon uptake ranged from 8% of photosynthetic assimilation just below the ice to 60% in the lower euphotic zone, ranging from 125.0-158.3 and 90.6-298.1 ng C/L/hr on 21 January and 20 February, respectively. Dark uptake in the aphotic zone ranged from 87.5-133.3 and 99.9-257.3 nanograms C/L/hr on 21 January and 20 February, respectively. Total assimilation of glucose carbon in the water column ranged from 29% to 36% of total carbon assimilated photosynthetically. Under the harsh winter conditions of low irradiation and temperature the mechanisms of photoheterotrophy and dark heterotrophy may be ecologically important in augmenting reduced photosynthetic production. DYNAMICS OF THE BYTHOTREPHES INVASION OF THE ST. LAWRENCE GREAT LAKES.
Erindale Coll., Mississauga (Ontario). Dept. of Zoology.
W. G. Sprules, H. P. Riessen, and E. H. Jin.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 3, p 346-351, 1990. 2 fig, 2 tab, 28 ref.

Descriptors: *Great Lakes, *Introduced species, *Limnology, *Waterfleas, *Zooplankton, Lake Michigan, Population dynamics, Spatial distribution.

Bythotrephes cederstroemii, a predatory planktonic cladoceran, has recently invaded the St. Lawrence Great Lakes from its native Eurasia. The species was probably transported in the ballast water of ships returning from a port such as Leningrad to take on cargo in the Great Lakes. Life history analyses of Bythrotrephes suggest that the invasion probably took place during the late 1970s or early 1980s when shipping traffic to the Great Lakes reached an all-time peak. This introduced cladoceran is highly vulnerable to fish predation due to its large size and prominent eye. B. cederstroemii has already reached densities in Lake Michigan typical of its native lakes. The feeding rates of B. cederstroemii are low compared to the reproductive potential of its plankton prey. Density and feeding rate data for Bythotrephes indicate that it is unlikely to have major impacts on prey populations in the Great Lakes. (Geiger-PTT)

EVALUATION OF SEDIMENT TRAPS IN LAKE ST. CLAIR, LAKE ONTARIO, AND HAMILTON HARBOUR.
National Water Research Inst., Burlington (Ontario). Lakes Research Branch.
F. M. Boyce, P. F. Hamblin, D. G. Robertson, and F. Chiocchio.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 3, p 366-379, 1990. 7 fig, 5 tab, 15 ref.

Descriptors: *Lake Ontario, *Lake St Clair, *Lake sediments, *Limnology, *Sampling, *Sediment sampler, *Suspended sediments, *Trap efficiency.

The five-chamber version of the Kenney sediment sampler and conventional sediment bottle traps with port diameters of 5, 10 and 15 mm were studied for their ability to sample suspended sediments in shallow, wave-dominated waters in Lake St. Clair, Lake Ontario, and Hamilton Harbor. The catch rates of the horizontally-ported chambers of the Kenney sampler correlated strongly and positively with the root mean square horizontal flow velocity over the trapping interval. A similar dependence was suspected for the settling tubes. There was no strong tendency for the traps tested to sort the sediment differentially; the catch rate was mainly controlled by hydrodynamic effects. The catch rates for the Kenney sampler and the bottle traps were strongly velocity dependent at Reynolds numbers (based on overall trap diameter) up to 10,000 and possibly beyond indicating boundary layer and wake effects at the trap itself. Until a more thorough investigation is made of the effects of horizontal velocity (both steady and oscillating) on all types of sediment traps, it is suggested that sediment traps in moving water be used primarily for qualitative analysis. SUDDEN, EXTREME LAKE ERIE STORM SURGES AND THE INTERACTION OF WIND STRESS, RESONANCE, AND GEOMETRY.
Ohio State Univ., Columbus. Dept. of Civil Engineering.
C. Libicki, and K. W. Bedford.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 3, p 380-395, 1990. 10 fig, 8 tab, 15 ref. NOAA, Ohio Sea Grant Contract NA79AA-D-00120 and NA80AA-D-0100.

Descriptors: *Lake Erie, *Limnology, *Model studies, *Resonance, *Seiches, *Storm surges, *Wind-driven currents, Friction, Simulation analysis, Topography, Water depth.

Wind-generated surges on Lake Erie are modeled in an attempt to explain their behavior and describe the influence of such factors as non-linear resonance dynamics, planform geometry, bottom topography, and friction on surge development, climax, and dissipation. The maximum surge was typically associated with the first characteristic to spend its entire transit beneath the wind stress. In the idealized case (flat, rectangular basin, no friction), surge height increased with stress band propagation speed until reaching a plateau at resonance. The chief effect upon the main surge of including the nonlinear term (at typical and stress values) is to decrease the surge height and time of arrival by approximately the same fraction. The inclusion of variable bottom topography generally exaggerated the surge height in basins that shallow from upwind to downwind and diminished surge height in the reverse case. Friction diminished surge heights and thickened the shock transition region. The large role played by frictional losses in storms progressing from northeast to southwest indicated the importance of properly accounting for these and other losses, such as nonreflective boundaries, in this type of storm. Variable width can serve to focus and thereby exaggerate surge heights by 40 to 50%. This exaggeration was especially pronounced at resonance at the Buffalo end of the lake. The criteria for resonance are fairly strict: a sharp wind front that remains intact for most of the length of the lake, wind and propagation velocities that are aligned with the lake axis, and a propagation speed that closely matches the free gravity wave speed. Since most destructive storms do not meet these criteria so that resonance is not a major contributing factor. (Author's abstract)
W91-03403

HISTORICAL VARIATION OF WATER LEVELS IN LAKES ERIE AND MICHIGAN-HURON.
National Water Research Inst., Burlington (Ontario). Research and Applications Branch.
C. T. Bishop.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 3, p 406-425, 1990. 9 fig, 3 tab, 56 ref.

Descriptors: *Great Lakes, *Lake Erie, *Lake Huron, *Lake Michigan, *Limnology, *Paleohydrology, *Paleolimnology, *Water level fluctuations, Archaeology, Climatic changes, Dredging, High water mark, History, Stratigraphy.

The earliest reliable water level measurements for Lakes Erie and Michigan-Huron (these two lakes behave the same limnologically) recorded in 1819 showed record low water levels. These early measurements are compared with the modern data set beginning in 1860. Historical and archeological evidence at European settlements on the Great Lakes from the early 17th century sheds light on the water level history of these lakes prior to 1819. Rates of isostatic rebound are generally believed to be decreasing exponentially with time. Stratigraphic evidence from Lake Michigan-Huron over the past 1,800 yr is interpreted to deduce water levels over this time period. When the effects on the lake levels of isostatic rebound and man-made channel changes (dredging) were examined, it was concluded that, over at least the last 1,800 yr, climate-related variations in maximum mean annual water levels have probably not exceeded those measured on Lakes Erie and Michigan-Huron since A.D. 1819. (Author's abstract)
W91-03405

DETERMINATION OF AVAILABLE SUBSURFACE LIGHT FOR PHOTOCHEMICAL AND PHOTOBIOLOGICAL ACTIVITY.
National Water Research Inst., Burlington (Ontario). Rivers Research Branch.
J. H. Jerome, R. P. Bukata, and J. E. Bruton.
Journal of Great Lakes Research JGLRDE, Vol. 16, No. 3, p 436-443, 1990. 6 fig, 1 tab, 6 ref.

Descriptors: *Irradiation, *Light intensity, *Light penetration, *Limnology, Downwelling, Mathematical equations.

Appropriate determinations of available subsurface light for photochemical and photobiological processes require accurate estimates of the subsurface scalar irradiation. Quite often only values of downwelling irradiation are available. Therefore, two sets of multiplicative factors were derived. The first set converts a daily irradiation just above the surface into a daily scalar irradiation just below the surface. The second set converts an 'effective' (i.e., depth-averaged) daily irradiation for a specific photic zone into an 'effective' daily scalar irradiation for that photic zone. These multiplicative factors are presented as functions of the subsurface volume reflectance of the water for the volume reflectance range 0.0 to 0.14. For a latitude range appropriate to the Great Lakes, these multiplicative factors vary between 1.1 and 2.1. (Author's abstract)
W91-03407

QUANTITATIVE MODEL OF THE DISPERSAL OF DETRITAL INPUTS AND MINOR COMPOSITIONAL COMPONENTS IN LAKE MICHIGAN SEDIMENTS.
Michigan Univ., Ann Arbor. Dept. of Geological Sciences.
A. R. B. Zimmerman, and R. M. Owen.

Journal of Great Lakes Research JGLRDE, Vol. 16, No. 3, p 444-456, 1990. 9 fig, 4 tab, 58 ref. NOAA Sea Grant NA86AA-D-SG043.

Descriptors: *Detritus, *Great Lakes, *Lake Michigan, *Lake sediments, *Limnology, *Mathematical models, *Model studies, *Sediment transport, Carbonates, Manganese, Particle size, Sediment erosion.

Mathematical models were developed to ascertain the sources, distribution, and fate of sedimentary material entering Lake Michigan. Major compositional end-members were identified by a modified Q-mode factor analysis procedure, and estimates of the relative amount of each end-member in each sample were obtained by linear programming. Four factors account for 93.8% of the total variance. These are interpreted as representing the inputs of fine-grained (Factor 1), and coarse-grained (Factor 2) detrital minerals, manganous carbonate (Factor 3) and non-manganous carbonate (Factor 4) to the lake sediment. Significant linear correlations between the relative amount of each compositional end-member and the grain-size distribution for each sample support these interpretations. Contour plots of end-member distributions suggest that the sediment chemistry of Lake Michigan is primarily influenced by regional-scale physical processes. In a revised version of the model, the distribution of minor sediment components (ferromanganese oxyhydroxides and siliceous plankton tests) were examined. Each model accounted for approximately 90% of the measured elemental concentrations in lake sediment. This modeling approach is a viable method for determining the distribution of sedimentary inputs in large lacustrine basins, and may also be useful in monitoring the dispersal pathways of coastal erosion products or chemical pollutants. LARGE SPATIAL AND TEMPORAL BIOLOGICAL VARIABILITY OF INDIAN RIVER LAGOON.
Saint Johns River Water Management District, Palatka, FL.
R. W. Virnstein.
Florida Scientist FLSCAQ, Vol. 53, No. 3, p 249-256, Summer 1990. 2 fig, 26 ref.

Descriptors: *Biological properties, *Ecology, *Ecosystems, *Florida, *Habitats, *Indian River Lagoon, *Lagoons, *Species composition, Biological samples, Population density, Sampling, Seasonal variation, Spatial distribution, Species diversity, Temporal distribution, Variability.

A large biological variability exists in the Indian River lagoon system, both in spatial and temporal dimensions. Biotic communities in the northern end of the lagoon are temperate, whereas those in the southern part of the lagoon are tropical, e.g. Spartina marshes dominate in the north and mangrove forests and seagrass in the south. The fish fauna of the northern part of the lagoon system is strikingly depauperate when compared to that of the south. Over distances of only a few kilometers or even meters, species composition can change substantially, and densities can vary by two or three orders of magnitude. The lagoon of a few centuries ago was quite different from the lagoon of today. Large changes in submerged vegetation have occurred within the last decade. Changes between years often far exceed and, thus, obscure seasonal patterns. In the same habitat, day-to-day variation in samples collected may be large. Temporal and spatial variability can be used to identify the processes that produce the variability. It is concluded that a representative site or time period does not exist; therefore a sampling program for the Indian River lagoon must reflect the diversity of the system. (Author's abstract)

NITROGEN METABOLISM IN THE BRACKISH LAKE NAKANOUMI: IV. SEASONAL VARIATION OF NITRATE NITROGEN.
Shimane Univ., Matsue (Japan). Environmental Science Lab.
Y. Seike, K. Kondo, H. Hashitani, M. Okumura, and K. Fujinaga.
Japanese Journal of Limnology RIZAAU, Vol. 51, No. 3, p 137-147, 1990. 8 fig, 5 tab, 22 ref.

Descriptors: *Brackish water, *Chlorine, *Lake Nakanoumi, *Lakes, *Limnology, *Nitrates, *Nitrogen cycle, *Saline lakes, *Water chemistry, Japan, Nutrients, Rainfall, Seasonal variation, Snowmelt, Surface water.

The seasonal variation of nitrate in the upper layer in the brackish Lake Nakanoumi was investigated by the analysis of data collected monthly during the period of 1976-1986. Upward trends in nitrate concentration were found in the colder season (January to March), and also in the rainy season (July). In contrast to nitrate, chlorine levels decreased at the same time. A significant negative correlation between nitrate concentration and chlorine concentration in the surface water in Lake Nakanoumi was found in January, February, March and July. In addition, from the analysis of the correlation between the increment of nitrate concentration in the surface water and cumulative rainfall, it was concluded that the accumulation of nitrate in the upper layer is mainly caused by discharge from the rivers into the lake through rainfall and melted snow. W91-03452

SIGNIFICANCE OF LOW-OXYGEN ZONE FOR NITROGEN CYCLING IN A FRESHWATER LAKE: PRODUCTION OF N2O BY SIMULTANEOUS DENITRIFICATION AND NITRIFICATION.
Nagoya Univ. (Japan). Water Research Inst.
M. Yoh, A. Yagi, and H. Terai.
Japanese Journal of Limnology RIZAAU, Vol. 51, No. 3, p 163-171, 1990. 4 fig, 27 ref.

Descriptors: *Cycling nutrients, *Denitrification, *Lakes, *Limnology, *Nitrification, *Nitrogen cycle, Ammonium, Japan, Lake Kizake, Nitrogen, Oxygen depletion.

Denitrifying and nitrifying activities were determined to elucidate the mechanism of nitrous oxide accumulation in the oxygen-depleted zone of Lake Kizake. Both activities were detected without any substrate enrichments in a zone of low-oxygen content (0.03-0.14 ml/L), where nitrous oxide and nitrite had accumulated. The measured nitrifying activity roughly coincided with the ammonium utilization estimated from the ammonium budget in this zone during the observation period. On the basis of these activities and the change in nitrous oxide concentration, it was suggested that the observed nitrous oxide accumulation had dual origins of nitrification and denitrification and that these productions were in dynamic equilibrium with further reduction of nitrous oxide to nitrogen. The low-oxygen zone was found to be an active site for nitrogen cycling and was characterized by the presence of dissolved Mn and the absence of dissolved Fe and sulfide. (Author's abstract)

Japanese Journal of Limnology RIZAAU, Vol. 51, No. 3, p 173-184, 1990. 7 fig, 4 tab, 16 ref.

Descriptors: *Lake Nakanoumi, *Limnology, *Phytoplankton, *Saline lakes, *Salinity, *Species composition, *Water temperature, Algal blooms, Brackish water, Japan, Lagoons, Lakes.

The relationships between the occurrence of phytoplankton and salinity or water temperature were investigated for 8 years from 1979 to 1986 in brackish Lake Nakanoumi. Fourteen species such as Skeletonema costatum, Prorocentrum minimum, and Cyclotella nana were dominant in this lake. Five among the 14 species bloomed in conditions of water temperature less than optimal for their growth, whereas every species bloomed in optimum salinity conditions. These observations indicated that the occurrence of dominant phytoplankton species in the lake is more strongly controlled by salinity than by water temperature. A correlation between nutrient concentrations and phytoplankton blooms was not observed in Lake Nakanoumi. The result of a comparison of weighted mean value of water temperature and salinity for the two periods of 1974-1978 and 1979-1986 also indicated the greater importance of salinity than water temperature in the occurrence of phytoplankton blooms in Lake Nakanoumi. SESTONIC C:N:P RATIOS IN THE SOUTH BASIN OF LAKE BIWA WITH SPECIAL ATTENTION TO NUTRITIONAL STATE OF PHYTOPLANKTON.
Kyoto Univ., Otsu (Japan). Otsu Hydrobiological Station.
M. Nakanishi, O. Mitamura, and T. Matsubara.
Japanese Journal of Limnology RIZAAU, Vol. 51, No. 3, p 185-189, 1990. 3 fig, 1 tab, 17 ref.

Descriptors: *Japan, *Lake Biwa, *Lakes, *Limiting nutrients, *Limnology, *Nutrient concentrations, *Phytoplankton, Carbon, Nitrogen, Nutrient deficiency, Particulate matter, Phosphorous, Seasonal variation.

To estimate seasonal change in the nutritional state of phytoplankton in the south basin of Lake Biwa, surveys for the determination of particulate C:N:P ratios were conducted at five stations from May 1987 to May 1988. Levels of particulate carbon (PC), particulate nitrogen (PN) and particulate phosphorous (PP) varied in the ranges of 20-210, 3-32, and 0.13-1.09 micromol/L, respectively. Seasonal changes in PC:PN ratio were relatively constant at all stations except for October and/or November when the ratio exceeded 10. On the other hand, the PC:PP ratio often showed extraordinarily high values from May to mid-October.

The seasonal pattern of PN:PP ratio was similar to that observed for PC:PP ratio. The particulate C:N:P ratios indicated the possibility that phytoplankton were exposed frequently to moderate or severe phosphorous deficiency from May to October 1987, but little thereafter until May 1988, whereas they were not in the state of severe nitrogen deficiency except for a given time in November of 1987. MACROFAUNA OF ELODEIDS OF TWO LAKES OF DIFFERENT TROPHY. I. RELATIONSHIPS BETWEEN PLANTS AND STRUCTURE OF FAUNA COLONIZING THEM.
Akademia Rolnicza, Lublin (Poland). Dept. of Zoology and Hydrobiology.
R. Kornijow.
Ekologia Polska ELPLBS, Vol. 37, No. 1/2, p 31-48, 1989. 4 fig, 3 tab, 48 ref.

Descriptors: *Aquatic animals, *Eutrophic lakes, *Limnology, *Macrophytes, *Mesotrophic lakes, *Waterweeds, Aquatic biota, Aquatic plants, Biomass, Ecosystems, Lake Glebokie, Lake Piaseczno, Poland, Species composition, Species diversity.

Very little is known about the influence of lake fertility upon the relationships between macrohydrophytes and the species composition and abundance of fauna colonizing them. The composition and abundance of macrofauna living on elodeid species and how those elodeid species differ in habitat and life cycle was determined then evaluated for different environmental conditions at various stages of lake eutrophication. Studies were conducted between January 1983 and December 1984 in the eutrophic Lake Glebokie and mesotrophic Lake Piaseczno, Poland. Macrofauna colonizing six elodeid species were analyzed (Myriophyllum alternifolium DC., M. spicatum L., Ceratophyllum demersum L., Potamogeton praelongus Wulfen, P. Lucens L., and Elodia canadensis Rich). The preference of several fauna taxons for specific groups of elodeids varied with composition and degree of species diversity and by dominance structure. Greater differences in fauna density and biomass were observed in relation to fresh plant weight. Values were inversely proportional to plant biomass and to density and biomass of fauna, as they relate to bottom surface. These relationships were probably connected with the possibility of using food resources of a given habitat by invertebrates. The higher trophy in Lake Glebokie was reflected by poorer and slightly different quantitative composition, by smaller total species diversity and differently formed dominance structure, higher density and biomass of fauna as related to fresh plant weight and bottom surface, than in Lake Piaseczno. MACROFAUNA OF ELODEIDS OF TWO LAKES OF DIFFERENT TROPHY. II. DISTRIBUTION OF FAUNA LIVING ON PLANTS IN THE LITTORAL OF LAKES.
Akademia Rolnicza, Lublin (Poland). Dept. of Zoology and Hydrobiology.
R. Kornijow.
Ekologia Polska ELPLBS, Vol. 37, No. 1/2, p 49-57, 1989. 3 fig, 1 tab, 20 ref.

Descriptors: *Aquatic fauna, *Eutrophic lakes, *Limnology, *Macrophytes, *Mesotrophic lakes, *Poland, Aquatic biota, Biomass, Ecological effects, Hornwort, Invertebrates, Mesotrophy, Pondweeds, Species composition, Species diversity, Water depth, Water milfoil.

The horizontal distribution of fauna living on aquatic macrophytes is not well known, and very little information exists concerning the relationship between the depth at which plants grow and the qualitative and quantitative composition of invertebrates colonizing them. Studies were conducted on the occurrence of invertebrate fauna colonizing Myriophyllum alternifolium D.C., Ceratophyllum demersum L. and Potamogeton lucens L. in different types of littoral and at different depths. Mesotrophic Lake Piaseczno and eutrophic Lake Gleobkie, Poland were examined. Differences between the fauna colonizing different types of shore in the mesotrophic lake concerned mainly its species composition and dominance structure. In the eutrophic lake, its density and biomass caused the main differences between fauna, especially in relation to the bottom surface. The influence of depth on invertebrates was reflected mainly by their species composition and dominance structure, and was very distinct in the eutrophic lake. Species abundance was found to decrease with increasing depth. (See also W91-03477) (Mertz-PTT)

CORRELATION BETWEEN BIOMASS, CHLOROPHYLL-A, PHOTOSYNTHESIS AND PHYTOPLANKTON STRUCTURE IN A LAKE.
Akademia Rolnicza, Lublin (Poland). Inst. of Natural Foundations of Plant Production.
W. Wojciechowska.
Ekologia Polska ELPLBS, Vol. 37, No. 1/2, p 59-82, 1989. 10 fig, 4 tab, 33 ref.

Descriptors: *Chlorophyll, *Eutrophic lakes, *Lake Bikeze, *Limnology, *Phytoplankton, *Primary productivity, Biomass, Chlorophyll a, Fluctuations, Photosynthesis, Poland, Productivity, Species composition.

The relationship between phytoplankton biomass, chlorophyll concentration and primary production was investigated over one growing season (April-November) in 16 series, with each series lasting 3 consecutive days. Measurements were taken in shallow (3 m) eutrophic Lake Bikcze, Poland. Biomass, chlorophyll-a concentration and primary production were measured every day. No unequivocal correlation between the three parameters was found. The proportion of chlorophyll-a in phytoplankton biomass varied with phytoplankton structure, cell age and light . Daily variations in phytoplankton populations structures were found, with photosynthesis being limited by light, depending on phytoplankton structure. Ecological studies of phytoplankton are necessary to determine the taxonomic composition and dominance structure of the community studied. (Mertz-PTT)

HABITAT DIVERSITY AND FISH REPRODUCTIVE FUNCTION OF FLOODPLAIN ECOSYSTEMS.
Lyon-1 Univ., Villeurbanne (France). Lab. d'Ecologie des Eaux Douces.
G. H. Copp.
Environmental Biology of Fishes EBFID3, Vol. 26, No. 1, p 1-27, September 1989. 7 fig, 6 tab, 106 ref.

Descriptors: *Aquatic habitats, *Ecosystems, *Fish populations, *Flood plains, *Limnology, *Spawning, Biomass, Braided streams, Geomorphology, Hydrological regime, Introduced species, Lentic environment, Lotic environment, Meanders, Multivariate analysis, Sampling, Succession.

Fish reproduction in flood plain ecosystems, based on relative abundance and total biomass of 0+ juveniles, was studied using the synchronic approach to typological analysis in conjunction with Point Abundance Sampling by modified electrofishing. In three different flood plains of the Upper Rhone River, 1015 point samples yielding 4573 juveniles (0+) from 21 species were collected from 48 ecosystems of various geomorphological origin. The results demonstrate the lotic-to-lentic succession of flood plain ecosystems to be a series of nonsequential reproductive zones, with spawning conditions being reflected by the specific composition and guild structure of the young-of-the-year (YOY) fish assemblages. The habitat diversity and the fish reproductive potential of flood plain ecosystems are strongly influenced by geomorphological origin and by past and present hydrological conditions. The YOY assemblages of autogenically driven ecosystems (usually of anastomose or meander origin) tend to differ both in composition and in quantity from those found in allogenically driven ecosystems (generally of braided origin). Ecosystems of intermediate character, and fish reproduction thereof, occur as the result of either ecosystem rejuvenation or senescence: autogenically driven ecosystems by allogenic mechanisms, or allogenically driven ecosystems at similar and at different successional status, the flood plain as an entity is seen as 'stable' with respect to fish reproduction. DOWNSTREAM EFFECTS OF IMPOUNDMENTS ON THE WATER CHEMISTRY OF THE BUFFALO RIVER (EASTERN CAPE), SOUTH AFRICA.
Rhodes Univ., Grahamstown (South Africa). Inst. of Freshwater Studies.
R. W. Palmer, and J. H. O'Keefe.
Hydrobiologia HYDRB8, Vol. 202, No. 1/2, p 71-83, August 29, 1990. 5 fig, 3 tab, 44 ref.

Descriptors: *Dam effects, *Reservoirs, *South Africa, *Water chemistry, *Water quality, Agricultural runoff, Dams, Hydrological regime, Low flow, Nitrates, River flow, River systems, Water pollution effects.

Dams are physical barriers in river systems, and they and their associated impoundment water can result in changes to the natural flow regime, water temperature, sediment loads, and chemistry of the receiving river. The downstream effects of impoundments on the chemistry of pristine and polluted stretches of the Buffalo River were investigated in the context of the Serial Discontinuity Concept (SDC), which proposes that dams act as disruptions to the natural continuum of hydrological, physico-chemical, and biotic changes down an impounded river. Impoundments which received water from a near-pristine upper catchment caused alterations of the water quality which were consistent with the SDC, and recovery to riverine conditions was within 2.6 to 18.4 km of the dam, depending on flow. Impoundments which received agricultural runoff and urban effluents generally caused an improvement in the water quality of the downstream reaches (with the exception of nitrate concentrations, which were higher in the tailwaters compared to inflowing water). Impoundments with polluted inflows therefore usually 'reset' the river towards its natural condition, rather than acting as perturbations. This represents a reversal of the SDC described for pristine rivers. The downstream effects of impoundments on water chemistry therefore depend on the relative

impact of other catchment perturbations. These disturbances become more severe during low flow, and it is during this time that the impoundments have the greatest effect on the river. (Author's abstract)

The mechanisms by which blue-green algae become dominant in lakes has been a formidable problem generating a vast number of observations and a variety of hypotheses. Three bag experiments were performed in an acidic lake, Cheat Lake, West Virginia, to determine if an inoculation of the blue-green alga, Anabaena flos-aquae, could be maintained in: (1) acid environments in which the nitrate nitrogen:total phosphorus ratio was manipulated above and below 5; (2) environments in which the pH of the acid lake water was increased to pH 7 or 8, and the nitrate nitrogen:total phosphorus ratio was manipulated above and below 5; and (3) environments in which pH was increased to 7, and 10 micrograms/L phosphorus was added alone and in combination with 70 micrograms/L nitrogen. Algal biomass increased as the concentration of total phosphorus increased in the various treatments. Increased pH treatments with phosphorus addition displayed an initial lag in algal growth of 2 to 6 days followed by intense growth. Analysis of the species composition of the various treatments indicated that increasing pH and adding phosphorus or manipulating the nitrate nitrogen:total phosphorus ratio to less than 5 did not favor blue-green algal growth. These data suggest that the Anabaena flos-aquae inoculated was replaced by the indigenous algae in the environments provided. (Fish-PTT)

ALLOCHTHONOUS INPUT AND RETENTION IN A SMALL MOUNTAIN STREAM, SOUTH AFRICA.
Cape Town Univ. (South Africa). Dept. of Zoology.
B. A. Stewart, and B. R. Davies.
Hydrobiologia HYDRB8, Vol. 202, No. 3, p 135-146, August 31, 1990. 4 fig, 5 tab, 37 ref.

Descriptors: *Leaves, *Litter, *Mountain streams, *Nutrient transport, *Organic matter, *South Africa, *Stream ecology, Detritus, Low flow, River sediments, Seasonal variation, Stream order.

Allochthonous material entering small streams represents the primary energy base available to consumers in these systems. Allochthonous input and benthic coarse particulate organic matter (CPOM) standing stocks were investigated in a first-order stream in the Fynbos Biome in South Africa between May 1984 and April 1985. Monthly falls into Window Stream of all litter types (total) ranged from 11 (September) to 79 (March) g/sq-m. Total annual litter fall was 426 g dry weight, which corresponds to 1.2 g/sq-m/d. Flowers, fruits, and seeds contributed 37 g/sq-m, woody debris, 122 g/sq-m, and leaves 267 g/sq-m to this total. Leaf fall from native trees, which accounted for approximately 57% of total litter input (244 g/sq-m/a), was significantly higher in summer than in winter. The summer peak in leaf fall recorded is far smaller and more protracted than the autumnal peak recorded for many Northern Hemisphere streams. Monthly total standing stocks of CPOM ranged from 14 g dry weight/sq-m in January to 69 g/sq-m in August, and a mean total CPOM standing stock of 41 g/sq-m/month was estimated. This comprised 18 g/sq-m/month soft litter, and 23 g/sq-m/month hard litter. CPOM standing stocks showed no seasonal trends, and with the exception of two species, standing stocks of endemic leaf species reflected their contributions to the total litter fall. Contrary to earlier reports for streams in the Fynbos Biome, Window Stream has CPOM standing stocks well within the ranges reported for low-order streams worldwide. (Author's abstract)

DEPTH-TIME DISTRIBUTIONS OF DETRITUS DEPOSITIONS IN LAKE NEMI (VOLCANIC LAKE OF CENTRAL ITALY).
Rome Univ. (Italy). Dipt. di Genetica e Biologia Molecolare.
L. Rossi, L. Picciafuoco, and A. Basset.
Hydrobiologia HYDRB8, Vol. 202, No. 3, p 185-195, August 31, 1990. 4 fig, 2 tab, 28 ref.

Descriptors: *Deposition, *Detritus, *Italy, *Lake sediments, *Limnology, *Organic matter, Bottom sediments, Cores, Ecosystems, Littoral zone, Plankton, Sediment analysis, Sedimentation.

Organic detritus is an important component of lake ecosystems. The depth-time distributions of detritus depositions onto lake bottom and the amount of resident organic matter on the upper layer of the bottom have been assessed in a volcanic lake (Lake Nemi in central Italy). Depositions were sampled monthly across the lake at four depths (0.2 m, 2 m, 6 m, and 30 m) during two years (1983-1984). Organic and ash fractions of sediment cores collected along a depth gradient were assessed in the summer of 1984. The results show: (1) the mean amount of organic matter deposition (size > 10 micrometers) is 1.24 g/sq-m/d dry weight (452.6 g/sq-m/year); (2) the metabolism of large particulate organic matter (LPOM) occurs primarily in the littoral zones not farther than 30 m offshore and the dispersibility of the LPOM may be predicted by a negative exponential model; (3) the deposition on the bottom comprised under the perimeter of about 80% of the lake surface, is principally autochthonous (planktonic in origin); and (4) the detritus settled out of the water column is not completely processed and about half of the total material enters the slow cycle of the sediment in the deepest zone of the lake. (Author's abstract)

FACTORS INFLUENCING FISH DISTRIBUTION AND COMMUNITY STRUCTURE IN A SMALL COASTAL RIVER IN SOUTHWESTERN COSTA RICA.
Wisconsin Univ.-Madison. Center for Limnology.
J. Lyons, and D. W. Schneider.
Hydrobiologia HYDRB8, Vol. 203, No. 1/2, p 1-14, September 14, 1990.4 fig, 4 tab, 41 ref.

Descriptors: *Aquatic habitats, *Coastal streams, *Costa Rica, *Fish populations, *Species diversity, *Stream ecology, Adaptation, Population density, Population dynamics, Riffles, River mouth, Saline water intrusion, Species composition, Tidal effects.

An evaluation was made of the relative importance of habitat size and diversity and distance from the ocean in explaining longitudinal patterns of fish distribution and community structure (species richness, evenness, and diversity) in the lower 5 km of the Rio Claro, a small coastal river in Corcovado National Park, southwestern Costa Rica, with a depauperate freshwater fish fauna. Twenty-two species in pools were observed, 19 of which occurred during quantitative sampling. Most of these species probably spent part of their lives in the Pacific Ocean. No species were observed in riffles, although these habitats were common and several taxa were adapted for life in fast turbulent water. Fish abundance, and species richness, evenness, and diversity were highest near the ocean, where high tides influenced river levels and salinity. Eight species were not observed further than 2900 m from the ocean, whereas six species were not encountered in samples nearest the ocean; the remaining eight species were present throughout the study area. Distance from the ocean was a better predictor of fish abundance and community structure than were pool width, pool depth, pool surface area, pool volume, amount of cover present, substrate diversity, or depth diversity. Qualitative comparisons of this data with previously-published data from 1980-1986, the fish assemblage of the Rio Claro is persistent in both species composition and relative abundance. (Author's abstract)

DYNAMIC ASPECT OF COARSE PARTICULATE ORGANIC MATTER (CPOM) ON THE SEDIMENT SURFACE OF A SECOND ORDER STREAM FREE OF DEBRIS DAMS (RITRODAT-LUNZ STUDY AREA).
Oesterreichische Akademie der Wissenschaften, Vienna. Inst. fuer Limnologie.
G. Bretschko.
Hydrobiologia HYDRB8, Vol. 203, No. 1/2, p 15-28, September 14, 1990. 9 fig, 6 tab, 27 ref.

Descriptors: *Austria, *Deposition, *Nutrient transport, *Organic matter, *Retention capacity, *River sediments, *Stream ecology, *Streams, Bottom sediments, Flood plains, Leaves, Riparian vegetation, Seasonal variation, Stream discharge, Stream order.

Allochthonous organic matter is the main energy basis for low order streams; quantity and quality of imported organic matter are important parameters, defining density and composition of the stream biocoenosis. Oberer Seebach, in the eastern alps of Austria, is a second order stream, draining an uninhabited and densely forested catchment. Because of flood control, the channel has been free of debris dams for more than a century. The study site is characterized by riparian vegetation and the distribution of dry and channel overflow areas. Amounts of leaf material deposited on the sediment surface of the channel are significantly larger during defoliation (20 days) and shortly afterwards ('accumulation period,' 6.64 g/sq-m (110 days) and 29.42 g/sq-m dry weight (133 days, mean of five years) for wet and dry areas, respectively) than during the rest of the year ('intermediate period,' 0.98 and 3.94 g/sq-m (mean of five years) for wet and dry areas, respectively). Woody debris is too scarce to increase the retention capacity. Deposition of leaf material depends on the interaction of input (wind-drift and bank runoff, 124 and 85 g/sq-m for the accumulation and intermediate period, respectively), discharge regime and the relationship between dry and wet channel areas. Periodically inundated areas increase the retention capacity of the stream channel and are comparable with the interrelationship between stream and flood plain. (Author's abstract)

PREDOMINANCE OF PICOPLANKTON AND NANOPLANKTON IN EUTROPHIC CALDER LAKE.
Fordham Univ., Armonk, NY. Louis Calder Conservation and Ecology Study Center.
J. D. Wehr.
Hydrobiologia HYDRB8, Vol. 203, No. 1/2, p 35-44, September 14, 1990. 7 fig, 3 tab, 33 ref.

Descriptors: *Algae, *Eutrophic lakes, *Limiting nutrients, *Limnology, *Phytoplankton, Biomass, Cyanophyta, Dinoflagellates, Ecosystems, Microbiological studies, New York, Nitrogen, Nutrient concentrations, Phosphorus, Primary productivity.

A study was conducted to examine factors regulating the biomass of algal picoplankton in Calder Lake, a small eutrophic lake in southern New York state. A particular focus was a current paradigm which suggests that larger cells may dominate i

nutrient-rich waters, while smaller cells may predominate only in oligotrophic waters. Over two years, phytoplankton biomass consisted predominantly (74% on average) of very small organisms; nanoplankton (<20 to 2 micrometers: 39%) and picoplankton (<2 micrometers to 0.2 micrometers: 35%), despite the presence of surface blooms of colonial cyanobacteria (Microcystis aeruginosa, Anabaena limnetica), and dense metalimnetic populations of the dinoflagellate Ceratium hirundinella. This dimictic system is characterized by relatively high levels of total P, inorganic P, and total inorganic N, but larger forms were rarely the most abundant. Unlike some marine systems, greater abundance of algal picoplankton was not associated with deeper strata (low light), or warmer temperatures. Data suggest that midsummer nutrient limitation, especially P-limitation, favors the development of picoplankton and nanoplankton in the limnetic zone of eutrophic lakes. (Author's abstract)

LITTERFALL, LEAF DECOMPOSITION AND LITTER COLONIZATION OF TESSARIA INTEGRIFOLIA (COMPOSITAE) IN THE PARANA RIVER FLOODPLAIN.
Centro de Ecologia Aplicada del Litoral, Corrientes (Argentina).
J. J. Neiff, and A. P. de Poi.
Hydrobiologia HYDRB8, Vol. 203, No. 1/2, p 45-52, September 14, 1990. 2 fig, 2 tab, 31 ref.

Descriptors: *Colonization, *Decomposing organic matter, *Flood plain sediments, *Floodplain forests, *Invertebrates, *Leaves, *Litter, *Parana River, *Stream ecology, Argentina, Forest ecosystems, Nutrient concentrations, Organic matter, River sediments, Seasonal variation.

Litterfall and leaf decomposition rates were measured in Choui Island, 45 km downstream from the confluence of the Parana and Paraguay Rivers, in Argentina. The material was collected biweekly from April 1985 through September 1986. Decomposition was measured in situ by the litter bag technique. Annual litterfall of Tessaria integrifolia gallery forest measured in the period April 1985 to March 1986 was 8.15 t/ha. Leaf litterfall was seasonal, i.e. significantly less leaf litter was shed during the high water phase than during the low water phase. The 'half life' of the T. integrifolia litter over 38 days of decomposition was 20 days. At the beginning of the experiment, 15 and 38 days subsamples of remaining detritus were analyzed in order to determine changes in the nutrient content. After 38 days of incubation, the order of nutrient disappearance was Ca>K>N>Mg>Na>P. The number of invertebrates per g remaining litter of T. integrifolia increased between incubations days 7 and 31. Collector-gatherers were more abundant after 38 days incubation; there were no shredders colonizing the leaf litter bags. (Author's abstract)
W91-03495

ACCURACY OF POPULATION DENSITY ESTIMATES OF A HORIZONTALLY DISTRIBUTED ZOOPLANKTON COMMUNITY IN DUTCH FISH PONDS.
Agricultural Univ., Wageningen (Netherlands). Dept. of Fish Culture and Inland Fisheries.
E. Verreth.
Hydrobiologia HYDRB8, Vol. 203, No. 1/2, p 53-, September 14, 1990. 5 tab, 18 ref.

Descriptors: *Fish ponds, *Limnology, *Sampling, The Netherlands, *Zooplankton, Copepods, Distribution patterns, Fish farming, Microbiological studies, Population density, Precision, Variation efficient, Waterfleas.

To elucidate the effect of the horizontal distribution of different zooplankton populations on the accuracy of population density estimates in a fish pond, 40 samples were taken according to a rectangular grid which divided the pond into 5 longitudinal rows and 10 transversal columns. The zooplankton consisted of 55% copepods, 43% cladocerans, and 2% Rotatoria. The index of patchiness was mostly higher than 1, revealing a strongly clumped distribution. A more passive wind-induced distribution was detected for most taxonomic groups. Based on the calculated coefficients of variation, a table of the accuracies of the density estimates in relation to the number of samples was presented. For more detailed studies on a particular species population, about 25 samples (column samples of 10 L each) are needed to obtain an accuracy varying between 10 and 20%, depending on the taxonomic group. A slightly higher precision can be obtained, however at a strongly increasing effort. For the practice of fish farming, two to five sample stations should suffice to estimate the total zooplankton abundance with a 30 to 10% accuracy respectively. (Author's abstract)

HYPOLIMNETIC PROTOZOAN PLANKTON OF A EUTROPHIC LAKE.
Lancaster Univ. (England). Dept. of Biological Sciences.
J. Laybourn-Parry, J. Olver, and S. Rees.
Hydrobiologia HYDRB8, Vol. 203, No. 1/2, p 111-119, September 14, 1990. 7 fig, 27 ref. Natural Environment Research Council Grant GR3/6957.

Descriptors: *Eutrophic lakes, *Hypolimnion, *Limnology, *Plankton, *Protozoa, Benthic environment, Benthos, Biomass, Ecosystems, Epilimnion, Lake stratification, Migration, Population density, Seasonal distribution, Seasonal variation, Species composition, Thermocline.

The importance of the microzooplankton in ecological processes such as energy flow and biogeochemical cycling in the marine environment is well established. Freshwater studies have lagged behind, but there is a growing pool of information on the occurrence and importance of protozoan biomass in the plankton lakes from a range of latitudes. The seasonal distribution of benthic species in the water column above and below the thermocline in a small eutrophic lake was studied. During summer stratification populations of Spirostomum spp., Loxodes spp., Plagiopyla and Deltopylum become established in the plankton on or below the oxycline/thermocline. At shallow sites no migration occurred and populations of the migratory species in the benthos were sparse, with the exception of Plagiopyla which occurred in high densities in the sediment. Two distinct planktonic populations are established during stratification: an epilimnetic community of obligate planktonic ciliates and a hypolimnetic community of benthic migrants. EVALUATION OF THE FISHERIES OF THE MACKINAW RIVER BASIN IN CENTRAL ILLINOIS.
Illinois Dept. of Conservation, Aledo.
D. M. Day, R. W. Sauer, and W. A. Bertrand.
Transactions of the Illinois Academy of Science TISAAH, Vol. 83, No. 1/2, p 82-100, 1990. 4 fig, 5 tab, 25 ref. Federal Aid to Sport Fish Restoration Project F67R; Illinois Department of Conservation, Division of Fisheries.

Descriptors: *Black bass, *Ecological effects, *Fish populations, *Illinois, *Stream fisheries, *Water pollution effects, Bass, Carp, Habitats, Recreation demand, Species composition, Species diversity, Stream biota, Water quality trends, Water resources management.

In 1987, on the Mackinaw River Basin in central Illinois, fish data were collected as part of an ongoing effort by the Illinois Department of Conservation (IDOC) Streams Program to assess statewide stream quality. Fifty-nine fish species were collected from 22 sites. On the Mackinaw River, stations downstream of the town of Mackinaw showed generally lower evenness, lower species richness and lower 'biotic integrity' as indicated by the Alternated Index of Biotic Integrity (AIBI), compared to stations upstream. More intensive investigations are warranted to isolate the habitat or water quality parameters responsible for this change and to determine the potential for implementation of habitat enhancement techniques in this downstream section. Several tributaries, including Panther Creek, Walnut Creek, and Henline Creek, were very high quality as seen with the IBI and appear to be smallmouth bass nurseries. Fish body condition as estimated by relative weight, was good for carp (values near 100) and fair for smallmouth bass (values ranging from 80 to 95). With its diverse fish fauna, aesthetic value, multiple recreational uses including fishing, swimming, canoeing, and hiking, the Mackinaw River represents one of the highest quality streams in Illinois and it is within the public interest to protect this stream from deleterious impacts. DYNAMICS OF TURBIDITY CURRENTS MEASURED IN KATSURAZAWA RESERVOIR, HOKKAIDO, JAPAN.
Hokkaido Univ., Sapporo (Japan). Dept. of Geophysics.
K. Chikita, and Y. Okumura.
Journal of Hydrology JHYDA7, Vol. 117, No. 1/4, p 323-338, September 1990. 9 fig, 2 tab, 23 ref.

Descriptors: *Lake sediments, *Reservoirs, *Sediment discharge, *Sediments, *Turbidity currents, *Turbidity flow, Diurnal variation, Flow velocity, Hokkaido, Japan, Katsurazawa Reservoir, Mathematical analysis, Reservoir sediments, Reynolds number, Temperature gradient, Underflow, Water temperature.

The movement of turbid underflows in a reservoir was examined using three recording current meters. The density underflows, called turbidity currents, are induced by sediment discharge in the inflow system during the spring thaw. Continuous measurement near the reservoir bottom at two longitudinally located stations showed the characteristic diurnal variations of flow velocity and temperature, and decreasing temperature in the downslope direction. The diurnal temperature variations correspond to the diurnal variations of sediment discharge and its temperature in the inflow system, and the decreasing temperature downslope is explained by the entrainment of upper, cold water which turbidity currents induce. Assuming the water temperature to be 0 C, two mixing coefficients and turbidity-current discharge at the stations were numerically obtained. Applying Manning's equation to the critical, low turbidity-current discharge, a value of 1.51 was obtained for the roughness coefficient, n. Hence, assuming n to be constant, Reynolds number, Re, and densimetric Froude number, Fd, for the turbidity currents were evaluated at 71,000-580,000 and 1.5-4.4, respectively. The entrainment coefficient, Ee, from the equation of continuity holds a significant correlation with 'overall Richardson number'. Decreasing entrainment is due to decreasing friction at the interface with the relative increase of kinetic energy. This could be applied to turbidity currents with Re of the order of 100,000. The downslope movement of turbidity currents with the diurnal variations of discharge and temperature is also explained by the longitudinal propagation of long

waves. These could change from kinematic to intermediate waves with increasing discharge. (Author's abstract)

GREAT LAKES: LIVING WITH NORTH AMERICA'S INLAND WATERS.
Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1988. 296p. Edited by D. H. Hickcox.

Descriptors: *Great Lakes, *Lake management, *Symposium, *Water policy, *Water resources management, Canada, Climatic changes, Groundwater, Lake fisheries, Lake shores, Recreation, Water pollution sources, Water quality control, Water use.

The Great Lakes of North America, the world's largest assemblage of fresh water, have exerted tremendous influence on the settlement and economic development of North America's interior. Today, 40 million people in eight states and two provinces inhabit the Great Lakes basin. Issues facing the Great Lakes include lakeshore development; increased recreation; domestic and industrial water use; sanitation; navigation; electrical power generation by nuclear, coal-fired, and hydroelectric plants; irrigation; fisheries; wetland preservation; endangered species preservation; shoreline protection; and lake levels. Perhaps the most serious problem facing the Great Lakes is water pollution in its many facets: nonpoint pollution, point source pollution, airborne, in-place (lakebed sediments), and pollution from groundwater. The intense urbanization of the Great Lakes basin and extensive agriculture in the basin ensure that large amounts of pollutants enter the lakes. The papers included in the Great Lakes symposium address many of the problems facing the Great Lakes. They are generally organized into sections covering: Great Lakes policy and management, water levels, climate, water quality, groundwater, and fisheries and recreation. Their authors have been educated in several different disciplines and represent many different constituencies. Some papers focus on site-specific topics; others are wide-ranging in scope and not every topic is evenly covered. However, all authors share a mutual concern for the Great Lakes and the pressing need to find common solutions to the diverse problems facing the lakes. (See W91-03673 thru W91-03703) (Fish-PTT)

In light of ever-increasing demand and multiple use of Lake Ontario resources, a clear understanding of the complex interactions among and between system components is vital. Data from various disciplines were examined to determine some of the long-term trends in Lake Ontario and to suggest some potential causative factors for changes observed over time. Demographic shifts coupled with environmental regulations have played a major role in improving water quality. Decreases in phosphorus and phytoplankton, although corresponding to decreased system loading, also appear to be affected by increases in fish biomass from stocking. Linkages between toxic contaminants and system production are becoming more evident. Interlake comparisons suggest less productive systems are more heavily burdened with toxic reserves than more productive systems. There is also evidence demonstrating long-term persistence of these chemicals in Lake Ontario: indicator organisms in sediment profiles; trace organic contaminants in herring gull eggs and lake trout; and interlake ecosystem cycling. It is evident that natural resource managers must develop a better appreciation for the interconnectedness of water quality and fisheries resources problems associated with managing ecological processes, which are often viewed otherwise in isolation from one another. The Great Lakes are one of our nation's greatest water resources containing 95% of the nation's and 20% of the world's fresh surface water. At the present time, all of the Great Lakes except for Lake Ontario, are receding from record high lake levels for this century. The high lake levels have had a severe impact upon the riparian interests around the lakes. Storms superimposed on the high lake levels have resulted in extensive flooding, houses destroyed, extreme erosion and bluff damage, marina problems, and a loss of habitat for various forms of wildlife. Historic fluctuations began with the retreat of the glaciers around 11,000 years ago, essentially stabilizing about 3,000 years ago. Gaging began in 1860, showing fluctuations from 183.40 m maximum (Lake Superior) to 73.86 m minimum (Lake Ontario). Seasonal cycles (30 to 45 cm) are superimposed on the annual cycles. Event-related fluctuations include storm surge, wind setup, and pressure jumps. The recorded lake levels include the effects of diversions, lake regulation, modifications to connecting channels, and consumptive use. Present lake levels show a rapid drop in November 1986 following the peak of the past high levels regime in 1986. Future Great Lakes levels scenarios can be developed on the basis of both normal climatic variability and the implication of global climatic warming. Higher lake level sequences could be expected in the future. It is important that policy analysis consider a wide range in water levels rather than concentrating only on the high lake level conditions of the past two decades or on the recent drought conditions. The Great Lakes and their connecting channels make up the largest body of fresh water in the world, with a total surface area of almost 95,000 square miles. Because of the vast land area and population that is influenced by the Great Lakes, fluctuations in the water levels are always a concern to the riparians and the users of this system. In the last 25 years, the Great Lakes have experienced a broad spectrum of water levels, from the mid-1960s lows to the mid-1970 and mid-1980 highs. Although there are many factors, artificial and natural, which affect lake levels, precipitation and evaporation are the prime causes of lake level fluctuations. Long-term fluctuation in the water levels are the result of persistent periods of wet or dry weather. While seasonal variations are moderately predictable, extreme climatic events and the duration of wet or dry periods are not predictable. Present predictions are based on analyses of historic data, including trends in water supplies to the lakes, antecedent precipitation and temperatures, and weather forecasts one month into the future. More dependable and longer-range weather forecasts would substantially improve the reliability of the lake level forecasts, and better enable management of this massive system. DEVELOPMENT OF THE LAKE ONTARIO SPORTFISHERY: SOCIOECONOMIC IMPACTS IN NEW YORK STATE.
New York Sea Grant Extension Program, Oswego.
C. P. Dawson, and M. P. Voiland.
IN: The Great Lakes: Living with North America's Inland Waters. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1988. p 259-268, 2 tab, 21 ref.

Descriptors: *Great Lakes, *Lake Ontario, *Lake management, *New York, *Recreation, *Sport fishing, *Water resources management, Boating, Economic impact, Ecosystems, Lake fisheries, Recreation demand, Social aspects, Water resources development.

Successful redevelopment of the Lake Ontario sportfishery by the New York State Department of Environmental Conservation began with the salmonid stocking program in 1968. The socioeconomic impacts of the sportfishery's development have not been as carefully monitored as the biological parameters and impacts. Fishery resource rehabilitation success on Lake Ontario stimulated coastal community facility and services development. Large increases in angler participation has spurred the development of the charter boat fishing industry, boater and angler access sites, fishing debris, the opening of new fishery-related businesses, and additional employment. Significant seasonal economic impacts from angler trip expenditures have occurred in many coastal communities. Less positive social and economic impacts are also reported such as trespassing, highway congestion, user conflicts, boating facility shortages, increased demand for community services, seasonal employment, concern for fish contaminants, and increased land values. Dramatic resource rehabilitation has led to increasing expectations by sportfishery constituencies for continued growth. A better assessment of and development for sportfishery user needs are necessary. Future management directions will require a greater consideration of social and economic, as well as biological, dimensions of fishery management to effectively and wisely utilize and protect Great Lakes fishery resources. DISCUSSION OF LAKE MICHIGAN RIP CURRENT HAZARDS TO SWIMMERS.
Indiana Dunes National Lakeshore, Porter, IN.
R. G. Littlefield.
IN: The Great Lakes: Living with North America's Inland Waters. Proceedings of a Symposium. American Water Resources Association, Bethesda, Maryland. 1988. p 279-284, 2 fig, 3 ref.

Descriptors: *Great Lakes, *Lake Michigan, *Lake management, *Recreation, *Rip currents, *Water resources management, Drowning, Indiana, Public waters, Sandbars, Swimming, Water currents.

The southern shoreline of Lake Michigan provides an estimated 15 million regional people a unique recreational opportunity in the form of some of the finest swimming and bathing beaches in this country. Unfortunately, from time to time, weather and nearshore conditions combine to form deadly rip currents which may be responsible for more than half of the water-related fatalities which occur on Lake Michigan beaches each summer. A rip current has the potential of transporting the unwary swimmer out into the deeper water beyond the reach of the shore very rapidly, usually before the average person can react in a defensive manner, and can cause the swimmer to panic and even drown. Rip currents are formed along the southern shore of Lake Michigan when northerly winds cause waves to break on the shallow nearshore sandbar in rapid succession, causing a current to form in the trough and flow parallel to the beach and toward the lowest part of the sandbar. As the water flows across this low area, it erodes a channel which allows the excess water behind the bar to spill lakeward as a powerful rip current. Ironically, the very forces that create rip currents can save swimmers and rescuers alike if they understand that: once carried beyond the sandbar, the current's strength greatly diminishes into a large slow vortex. A swimmer caught in this current should not attempt to swim shoreward against the current, but should swim to one side or the other and get out of the current to where the incoming

waves will carry them shoreward again. An understanding of the mechanics which cause rip currents can aid managers in reducing public exposure and the potential of liability. Experience gained from actions taken at Indiana Dunes National Lakeshore is readily transferable to other lakeshore situations. (See also W91-03672) (Fish-PTT)

ARE BLUE-GREEN ALGAE A SUITABLE FOOD FOR ZOOPLANKTON: AN OVERVIEW.
Istituto Italiano di Idrobiologia, Pallanza (Italy).
R. de Bernardi, and G. Giussani.
Hydrobiologia HYDRB8, Vol. 200/201, p 29-41, August 27, 1990. 9 fig, 3 tab, 55 ref.

Descriptors: *Algal control, *Cyanophyta, *Diets, *Eutrophic lakes, *Food chains, *Lake restoration, *Limnology, *Zooplankton, Biomanipulation, Bioremediation, Food habits, Water quality management.

One of the reasons suggested to explain the dominance of blue-green algae in eutrophic lakes is that they are not used as food by zooplankton, and even when ingested are poorly utilized. An increase in herbivores might be expected to result from biomanipulation of the aquatic food chain. A series of in-lake experimental results indicates that, after the food chain has been biomanipulated, there is a decrease in blue-green density in periods when there is an increase in herbivores. A question remaining is whether this is an accidental result or whether the two observations are related. The suitability of blue-greens as food for zooplankton has been investigated by many workers, with contrasting and inconclusive results. Two main factors seem to play important roles in determining the suitability of blue-green algae as food: (1) the biochemical properties of the different species, or different strains of the same species, and (2) the shape and size of the colonies. Biochemical properties can cause toxic effects on zooplankton, whereas size and shape may interfere strongly with filtering, thus reducing the possibility of gathering food. (Author's abstract)

During August, 1987, a series of limnocorral experiments was performed in lake La Caldera (southern Spain), a small winter-kill lake in which phytoplankton is strikingly nutrient-limited. The effects of biomanipulation on zooplankton-phytoplankton relationships was assessed by monitoring both individual species and whole-assemblage responses. Two sizes of enclosures were used (15 and 350 L) and two treatments were examined: (1) removal of zooplankton by 45-micrometer filter net and (2) doubling the natural grazing pressure by increasing the zooplankton concentration. Results show the two enclosure types to differ strikingly: flagellates disappeared from the small enclosures, resulting in four-fold to six-fold changes in chlorophyll a concentration and three-fold to four-fold changes in the number of individuals. Most species were grazed (a prey selectivity based on criteria other than size was observed) and their net growth rate increased with zooplankton concentration, causing a net increase in phytoplankton growth, a stimulatory effect probably related to nutrient regeneration that overrides the losses due to grazing. Descriptors: *Algal control, *Biocontrol, *Biomanipulation, *Lake restoration, *Limnology, *Plankton, *Trophic level, Biomass, Bioremediation, California, Castle Lake, Clear Lake, Daphnia, Eutrophic lakes, Food habits, Lake Tahoe, Oligotrophic lakes, Phytoplankton, Zooplankton.

An experimental study was conducted to compare algal responses to short-term biomanipulations of zooplankton in three California lakes that encompass a broad range of productivity (ultra-oligotrophic Lake Tahoe, mesotrophic Castle Lake, and strongly eutrophic Clear Lake). To assess the potential strength of grazing in each lake, algal responses to a 16-fold range of zooplankton biomass were evaluated. Algal responses to Daphnia over a range of Daphnia densities from 1-16 animals/L were compared. Effects of both ambient grazers and Daphnia were strong in Castle Lake. However, neither ambient zooplankton nor Daphnia had much impact on phytoplankton in Clear Lake. In Lake Tahoe, no grazing impacts could be demonstrated for the ambient zooplankton, but Daphnia grazing had dramatic effects. These results indicate weak coupling between phytoplankton and zooplankton in Clear Lake and Lake Tahoe, which lie near opposite extremes of lake trophic status for most lakes. These observations, along with work reported by other researchers, suggest that linkages between zooplankton and phytoplankton may be weak in lakes with either extremely low or high productivity. Biomanipulation approaches to recover hypereutrophic lakes that aim only to alter zooplankton size structure may be less effective if algal communities are dominated by large, inedible phytoplankton taxa. Hydrobiologia HYDRB8, Vol. 200/201, p 119-128, August 27, 1990. 4 fig, 2 tab, 23 ref.

Descriptors: *Biocontrol, *Biomanipulation, *Food chains, *Lake restoration, *Limnology, *Norway, *Nutrients, *Seasonal stability, Biomass, Cyanophyta, Daphnia, Enclosures, Fish, Food habits, Lake management, Lakes, Long-term studies, Monitoring, Nitrogen, Phosphorus, Phytoplankton, Roach, Water quality management.

Responses of phytoplankton biomass were monitored in pelagic enclosures subjected to manipulations with nutrients (+N/P), planktivore roach (Rutilus rutilus), and large grazers (Daphnia) in 18 bags during spring, summer, and autumn in mesotrophic Lake Gjersjoen (Norway). In general, the seasonal effects on phytoplankton biomass were more marked than the effects of biomanipulation. Primary top-down effects of fish on zooplankton were conspicuous in all bags, whereas control of phytoplankton growth by grazing was observed only in the nutrient-limited summer situation. The effect of nutrient additions was pronounced in summer, less in spring and autumn; additions of fish gave the most pronounced effect in spring. The phytoplankton/zooplankton biomass ratio remained high (10-100) in bags with fish, with the highest ratios in combination with fertilization. The ratio decreased in bags without fish to < 2 in most bags, but real grazing control was observed only in bags with addition of Daphnia. No direct grazing effects were observed on the absolute or relative biomass of cyanobacteria (mainly Oscillatoria aghardhii). The share of cyanobacteria in total phytoplankton biomass was lowest in summer (7-26%), higher in spring (39-63%) and more than 90% in the autumn experiment. The development of the cyanobacterial biomass was rather synchronous in all bags in all the three experiments. A high biomass of Daphnia gave no increase in the pool of dissolved nutrients in spring, a slight increase in summer and a pronounced increase in autumn. While a strong decrease in the P/C-cell quota of the phytoplankton was observed from spring to autumn, no effect of grazing or nutrient release could be related to this P/C status. The experiments indicate that such systems, with high and stable densities of inedible cyanobacteria, are rather insensitive to short-term (3-4 wk) biomanipulation efforts. This is supported by observations on the long-term development of the lake. (Author's abstract)

IMPACT OF WHITEFISH ON AN ENCLOSURE ECOSYSTEM IN A SHALLOW EUTROPHIC LAKE: SELECTIVE FEEDING OF FISH AND PREDATION EFFECTS ON ZOOPLANKTON COMMUNITIES.
National Inst. for Environmental Studies, Tsukuba (Japan). Environmental Biology Div.
T. Hanazato, T. Iwakuma, and H. Hayashi.
Hydrobiologia HYDRB8, Vol. 200/201, p 129-140, August 27, 1990. 4 fig, 2 tab, 41 ref. Ministry of Education, Science and Culture, Japan, Grants-in-Aid for Special Project Research 60129034 and 61134044.

Descriptors: *Eutrophic lakes, *Lake management, *Limnology, *Predation, Biomanipulation, Bioremediation, Crustaceans, Ecosystems, Enclosures, Food habits, Midges, Performance evaluation, Rotifers, Whitefish, Zooplankton.

Bag-type enclosures (75 cu m) with bottom sheets and tube-type enclosures (105 cu m), open to the bottom sediment, were stocked with exotic white-

fish (Coregonus lavaretus maraena) to study their predation effects on the plankton community. The fish fed mainly on adult chironomids during the period of their emergence (earlier part of the experimental period). Thereafter, the food preference was shifted to larvae of chironomids and crustacean zooplankters. The predation effects on the plankton community were not evident in the bag-type enclosures where zooplankton densities were consistently low. The fish reduced the crustacean populations composed of Bosmina fatalis, B. longirostris, and Cyclops vicinus, in the tube-type enclosures where the prey density was high (above ca. 50 individuals/L). The results suggested that the intensity of predation depended on the prey density. Rotifers increased in the fish enclosure, probably because Coregonus reduced the predation pressure by Cyclops vicinus on rotifers and allowed the latter to increase. In the fish enclosures no marked changes in species composition were observed. Zooplankton predated by the fish seemed to be distributed near the walls of the enclosures. Enclosure experiments for examining the effects of fish predation on pelagic zooplankton communities have various problems, such as changing the feeding habits of fish. Large bag-type (75 cu m) and tube-type (105 cu m) enclosures were set up in the shallow, eutrophic Lake Suwa (Japan) and were each stocked with exotic planktivorous whitefish (Coregonus lavaretus maraena). The release of whitefish caused an increase in nutrient concentration in the tube-type enclosure whereas no such increase was observed in the bag-type enclosure. Bottom sediment seemed to be an important source of chironomid food for whitefish. The proportion of phytoplankton measuring < 10 micrometer and 20-40 micrometer, which respectively corresponded to Ochromonas species and Cryptomonas species, was lower in the fish enclosures than in the control, which might have been caused by high grazing pressure by rotifers. The predation by whitefish might have affected the species composition of phytoplankton through reducing copepod predation on rotifers, not through reducing the densities of cladocerans which directly feed on phytoplankton as many investigators have reported. The phytoplankton biomass was not affected much by the release of fish. Possible reasons are that the increase in density of rotifers reduced the biomass of available phytoplankton and that inedible Cyanophyceae were in the decreasing phase of their seasonal succession and could not increase successfully in spite of elevated nutrient levels. Enclosures (17 cu m) were used in the mesotrophic area of Lake Balaton (Hungary) to determine the impact of benthivorous bream (Abramis brama L.) on the lower trophic levels during the summers of 1984-1986. In enclosures with a fish biomass similar to the biomass in the eutrophic area of the lake, the number of phytoplankton species was highest. In enclosures with a low fish biomass, the phytoplankton was dominated by the greens. A high biomass of bream in the mesotrophic basin caused bacterial production corresponding to that of the eutrophic part of the lake. Crustaceans were dominated by copepods and were unable to control phytoplankton peaks. Bottom-up effects of bream were more obvious than top-down effects and seem to be more important in the possible control of water quality. (Author's abstract)

Whole-lake food web manipulation was carried out in the hypertrophic Lake Zwemlust (The Netherlands) to study the effects on the lake's trophic status and to gain an insight into complex interactions among lake communities. Before manipulation this small (1.5 ha) and shallow (1.5 m) lake was characterized by Microcystis blooms in summer and high chlorophyll-a concentrations were common (about 250 microgram/L). In March 1987 the planktivorous and benthivorous fish species in the lake were completely removed, a new simple fish community (pike and rudd) was introduced, and artificial refuges were created. Light, climate, nutrient concentrations, phytoplankton, zooplankton, fish, macrophytes, and macrofauna were monitored during 1987, 1988, and 1989. After the manipulation, despite the still high P and N loads to the lake (about 2.2 g P/sq m/yr and about 5.3 g N/sq m/yr), the phytoplankton density was low (chlorophyll-a < 5 microgram/L), due to control by large zooplankton in spring and N-limitation in summer and autumn. A marked increase in the abundance of macrophytes and filamentous green algae in 1988 and 1989, as well as N loss due to denitrification, contributed to the N limitation of the phytoplankton. Before manipulation no submerged macro-vegetation was present, but in 1988, about 50% of the lake bottom was covered by macrophytes, increasing to 80% in 1989. This led to substantial accumulation of both N and P, namely 76% and 73%, respectively, of the total nutrients in the lake in particulate matter. The increase in macrophytes caused: (1) direct nuisance to swimmers and (2) the large-scale development of snails, especially Lymnaea peregra, which may harbor the parasite causing 'swimmers' itch.' Harvesting only about 3% of the total macrophyte biomass from the swimmers' area, twice a year, reduced this nuisance without adversely affecting the water clarity. (Author's abstract)

Experimental reduction of the fish stock in two shallow lakes in The Netherlands shows that such a biomanipulation can lead to a substantial increase in transparency, which is caused not only by a decrease in algal biomass, but by a decrease in resuspended sediment and detritus. A model was developed to describe transparency in relation to chlorophyll-a and inorganic, suspended solids (resuspended sediment). The use of this model showed that more than 50% of the turbidity in these shallow lakes before biomanipulation was determined by sediment resuspension, mainly caused by benthivorous fish. Another analysis reveals that the concentration of inorganic suspended solids and the biomass of benthivorous fish are positively correlated, and that even in the absence of algae a benthivorous fish biomass of 600 kg/ha can reduce the Secchi depth to 0.4 m in shallow lakes. In addition, algal biomass also appeared to be reduced indirectly by removal of benthivorous fish. Reduction of benthivorous fish is necessary to get macrophytes and macrophytes seem necessary to keep the algal biomass low in nutrient-rich shallow lakes. It is concluded that the impact of benthivorous fish on the turbidity can be large, especially in shallow lakes. (Author's abstract)
